**STEEL WIRE HAY BANDS.****IMPROVED WIRE BAND.**

Patented Oct. 3, 1876. Jan. 9, 1877.

**EXCELSIOR WIRE BAND.**

Patented March 10, 1868. Reissued March 23, 1869.

**ADJUSTABLE WIRE BAND.**

Patented June 29, 1880.

MADE OF THE BEST SELECTED STEEL WIRE.

The strongest and most convenient Hay Bands ever offered.

**WRITE FOR PRICES.**

Orders or letters of inquiry will receive prompt attention. Address

**BROCKNER & EVANS,**

Sole Manufacturers. Importers of Galvanized Wire Nettings and Sheep Fencing. Dealers in Patent Steel-Barb Fence Wire.

422 West Street, New York City.

**CALVANIZED CABLE FENCE STRAND.**

The only Wire Fence that stands the test of time.

**NO BARBS.**

PHILIP S. JUSTICE, 14 N. 5th St., Philadelphia, Pa.

**SEDGWICK BROS.,****STEEL WIRE FENCE.**

Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry, as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks, or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every respect, and far better than barbed wire. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick gates, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength, and durability. Ask hardware dealers, or for price list and particulars address **SEDGWICK BROS., Richmond, Ind.**

**The "Centennial" Fanning Mill.**

The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover, and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers.

**STEPHEN FREEMAN & SON,** Racine, Wis.

**I. X. L. SPRING TUG LINK**

Affords the greatest protection to **HORSES**, Harness, Wagons, Plows, Mowers and Reapers. Reliable and guaranteed as represented. Protect your Horse, save your money, by procuring the celebrated **D. RISHER & CO.'S** I. X. L. Spring Tug Link. Ask your hardware man for them, or send to **D. RISHER & CO.,** Corner of 4th and Wood Streets, Pittsburgh, Pa.

**EVAPORATING FRUIT.**

**SENT FREE** Treatise on improved methods. Tables, yields, prices, profits, and general statistics. **AMOS STOUTER, Chambersburg, Pa.**

# \$1000. REWARD

For any Washing Machine that will Wash Cleaner, Quicker, with Less Labor and Wear and Tear of Clothes than the  
**ROBBINS FAMILY WASHER AND BLEACHER, PAT'D OCT. 3, 1871.**

THE ORIGINAL AND ONLY PERFECT SELF-OPERATING WASHER IN THE WORLD.

No rubbing required. No more yellow clothes nor hard work on washing day. It will wash anything from a lace curtain to a horse blanket, and can not get out of order.

Good Agents Wanted, both Male and Female, to whom Liberal Inducements are Offered. Agents can make from \$10 to \$100 per week.

## THE ART OF CLEANSING FABRICS

is yet but imperfectly understood by thousands of good house-keepers. The numerous devices of friction rollers, pounders, squeezers, dashers, agitators, steam wash-boilers, etc., have all failed in one or more of the three essential points, namely: The saving of labor, wear and tear of clothes, or in perfectly extracting the dirt and discoloration; all of which are accomplished by the ROBBINS FAMILY WASHER AND BLEACHER.

## WHAT IS IT REMOVES THE DIRT?

You may ask washer-women and house-keepers, and your answer from nine out of ten will be, "Plenty of elbow-grease," or in other words, laborious rubbing upon the wash-board. And such is the case, for you first rub soap upon the cloth, and then you have to rub it in, to make the dirt soluble; but does that remove it? No; to do that you must dip it in the water and rub repeatedly to force water through the fabric, again and again. That is what removes dirt after having been softened by the chemical action of the soap.

The way in which this could be most economically accomplished has been developed in the FAMILY WASHER AND BLEACHER, which embodies all the above points.

Mechanical devices take the entire time of a person during the whole wash, and will not remove streaks from clothes. With the Washer and Bleacher, washing, baking, and housework are contemporaneous operations—the fire doing the washing and baking, while the housewife does her housework.

It is harder work to operate these mechanical devices than to use the common wash-board. They are constantly getting out of order, and wear out in a short time. They wear out clothes faster than the rubbing-board, because the friction is so much greater.

All who have tried steam wash-boilers will unite with us in saying: They do not give satisfaction.

## WE WILL EXPLAIN WHY.

As stated, *water force* is what removes dirt from the fibre of the cloth. A large body of water is required to hold in solution comparatively small amount of dirt. Steam wash-boilers cannot accomplish the desired result. They do not contain enough water to hold the dirt in solution.

In order to remove the dirt from *steamed* clothes, they must be washed out in water at nearly boiling heat, for if you use water at a lower temperature it causes the fabric to contract, which "sets the dirt," thus causing the clothes to turn yellow. An essential thing to be mentioned is the *rotting* of clothes by *steam wash-boilers*, because of the small quantity of water used.

Everybody knows that a large quantity of soap dissolved in a small body of water must necessarily form an *exceedingly strong alkali*, which, after the clothes are packed in the steam wash-boiler, is converted into steam, every moment becoming more concentrated till the clothes are removed. A few such washings and what is the result? Simply this: Your clothes fall to pieces of their own weight, and you pronounce *steam wash-boilers* (as they are) a *failure*.

THE PRINCIPLE OF THE WASHER AND BLEACHER embodies all the essential points. First, we have the desired heat which expands the fabric and causes it to discharge the dirt.

Second, we obtain a powerful suction beneath the clothes, which produces a rapid *downward current* or *water force* through and through them, thereby removing the dirt. Third, we use a *large body of water*, which holds the dirt in solution. Fourth, we use but a small quantity of soap. Fifth, the washing is done by water, and *not by steam*. This process cannot injure fabrics. It cleanses thoroughly, *ripping the clothes* being all that is required to complete the operation.

## THE PHILOSOPHY OF THE WASHER AND BLEACHER IS THIS:

We have 5 lbs. of metal, which attains a much greater degree of heat than the water surrounding it, consequently the water *underneath* the Washer becomes hotter and more expansive than in any other part of the boiler, and is thereby thrown to the surface through the tube: thus tending to produce a vacuum underneath the Washer at the bottom of the boiler, into which the water is rapidly drawn.

As it passes along the channels of the Washer, the curved and contracted throats of which prevent its flowing backward, it becomes hotter and hotter, consequently more expansive and more forcible until thrown to the surface, thus producing a powerful suction beneath the clothes through which the water must pass in a rapid *downward current*, thereby obtaining a *water force* which cannot be obtained by any other method known in cleansing fabrics. Thus, we get a combination. **FIRST, WE HAVE THE DESIRED HEAT. SECOND, PERFECT CHEMICAL ACTION OF THE SOAP. THIRD, FORCE OF WATER—ALL OF WHICH ARE REQUIRED TO THOROUGHLY CLEANSE AND PURIFY ANY FABRIC.**

## THE IMPROVED WASHER.

has a perfect fitting pipe, and is a combination of metals which does not become sticky or dirty. It comes out of the boiler as bright as new.

## THE CAPACITY OF THE WASHER AND BLEACHER.

There are two sizes. No. 1, the family size; No. 2, suitable for small hotels, restaurants, and barber-shops, boarding-houses, etc.

The Washer is composed of metal and cannot get out of order.

The family size weighs about 5 lbs., and is only 8 inches long by 5 inches wide, and 1 1/2-inch deep.

The discharge pipe is 13 inches high over that, and is 1 1/2 inch in diameter. It throws water in a solid, unbroken stream, at the rate of 6 to 8 gallons per minute. It will work in any flat bottom boiler. It takes only 3 or 4 ounces of soap in 10 or 12 gallons of water, and will wash bed or table linen, a boiler full in 10 to 15 minutes, wearing apparel in from 10 to 30 minutes, and will remove streaks without rubbing; requires no previous preparation of the clothes, such as soaking over night. Take the clothes dry, and when the Washer gets *thoroughly at work*, fill the boiler as full as it will hold by gently pressing them down with a stick. Use no chemicals, only good soap and soft water. If the water is hard, it may be softened by a small piece of borax, which is harmless.

FOR LACE CURTAINS this Washer is *invaluable*. It cleanses them as no other process can, and without the slightest danger of injury.

No. 2, or small hotel size, is 8 1/2 in. long, 7 1/2 in. wide, 1 1/2 in. deep, and weighs about 8 lbs. It will work in a flat-bottom boiler holding 15 to 25 gallons, and wash of average pieces from 1,500 to 2,000 per day; or it may be used in any smaller boiler that has a flat bottom large enough for it to rest upon. For hospitals this Washer is pronounced by the medical faculty invaluable, being the most *powerful disinfectant* known; leaving the fabrics pure as when new. By bleachers and chemists it is said to be the most powerful method of removing dirt and vegetable matter from fabrics ever known.

## THE INDUCEMENTS WE OFFER.

We want a Local Agent in every town in the United States. We know from experience that reliable, energetic men can make money selling the Washer and Bleacher in any community.

We want first-class men as GENERAL AGENTS; men capable of managing one or more counties.

To such we give a duly executed Certificate of Agency. We furnish descriptive circulars for distribution among families. Also large posters for advertising in public places. Printed directions for using are sent with each Washer.

The retail price of No. 1 WASHER, in New York, is \$3.50; No. 2 WASHER, \$5.00; No. 1, \$24.00 per dozen; No. 2, \$36.00 per dozen.

## SAMPLE, OR SINGLE WASHERS.

WE SEND SINGLE OR SAMPLE NO. 1 WASHERS, PREPAID, TO YOUR NEAREST RAILWAY EXPRESS OFFICE, in any part of the United States east of the Mississippi and Missouri Rivers, also in Kansas, Nebraska, Arkansas, Louisiana, and Texas, for \$3.50.

## SPECIAL NOTICE.

As to the reliability of this Company, we refer you to the MERCANTILE NATIONAL BANK of this city, or to any Express Company in New York. Also to the Publishers of the following named well known leading journals, viz.:—New York—*American Agriculturist*, *Weekly Sun*, *Weekly Times*, *Weekly Tribune*, *Weekly Witness*, *Weekly World*, *Christian Advocate*, *Christian at Work*; Boston—*Youth's Companion*, *American Cultivator*; Chicago—*Inter-Ocean*, *Cincinnati Gazette*, *Springfield Farm & Fireside*, *St. Louis Journal of Agriculture*, *Detroit Free Press*, all of whom have frequently editorially endorsed us as well as our Washer. From the N. Y. *Weekly Tribune*, May 19, 1881:—"Washers Again.—We have several inquiries concerning the Robbins Washer and Bleacher. It does exactly what is claimed for it, and cheap at ten times its cost."

In ordering, write plainly your name, post-office, county, and State. Also the name of the express office to which you wish the Washer forwarded.

CASH MUST ACCOMPANY ALL ORDERS. Remit by Post-office Order or Registered Letter. We insure the safe delivery of all Washers ordered as above. Money may also be sent by draft on New York. Send for a sample and secure A BUSINESS THAT WILL PAY YOU WELL.

When you order or write, mention this paper. Address

**Bissell Manufacturing Co.**  
50 BARCLAY STREET, NEW YORK.

## FRENTRESS.

# Steel Wire Barb Fence

A new feature in the Gun line. It is light, compact; from 8 to 10 lbs. in weight. The Rifle is perfectly accurate. It has proved a great success for all kinds of shooting. All guns shipped on trial and guaranteed. Price \$75 to \$250. L. C. SMITH, Sole Maker of Baker Guns, Syracuse, N. Y.

## \$14 SHOT GUN!

The Best Double-Barreled Shot-Gun in the world for the money. Warrented genuine twist, with *Ask*. *Belt Box Wads, Box Caps and Wad Punch*. Also our celebrated Kentucky Rifle for \$12, warranted *no safe*. Send for illustrated Catalogue and Price Lists to **JAMES BOWN & SON, Enterprise Gun Works, 136 & 138 Wood St., Pittsburgh, Pa.** ESTABLISHED, 1848.

## VICTOR

## Double Huller Clover Machine

Is the only Huller that has ever hulled 100 bushels of seed in one day from damp and wet straw. Send for Descriptive Circular, which contains many letters confirming this. Hagerstown Agricultural Implement Mfg. Co., Hagerstown, Md. State where you saw Advertisement.

## Farmers' Report ON CLOVER HULLERS.

LaGrange, La Grange Co., Ind., May 27, 1880. Report of a Joint Committee appointed by the Agricultural Societies of St. Joseph County, Michigan, and La Grange County, Indiana, to test the relative merits of the VICTOR CLOVER HULLER, OF HAGERSTOWN, MARYLAND, and of the BIRDSELL MONITOR, JUNIOR, CLOVER HULLER, OF SOUTH BEND, INDIANA: WHEREAS, at the St. Joseph County, Michigan, Fair, held at Centerville, on the 21st day of May, 1880, an agreement was entered into by the representatives of the different machines to have a trial of their merits at the LaGrange County Fair on Thursday, May 27, a Joint Committee was formed, consisting of five from each of the two counties, and held such trial this day.

The Committee, in pursuance of the agreement, secured two two-horse-loads of clover, which had been stacked two winters, and brought them on the grounds, and determined that each machine should thresh one load, and then each RE-TRESH the straw which had been run through the other machine according to agreement.

At the conclusion of the trial the Committee repaired to Agricultural Hall, and, after due deliberation, unanimously decided in favor of the Victor for rapidity and excellency of work in all respects.

The Birdsell, from 1,339 pounds straw, threshed 37 pounds seed mixed with a large quantity of chaff; the Victor, from 1,240 pounds straw, threshed 48½ pounds seed mixed with a less quantity of chaff. The time occupied in threshing by the Victor was eight minutes less than that occupied by the Birdsell. From the straw of the Victor the Birdsell machine re-threshed two pounds seed; from the straw of the Birdsell the Victor rethreshed eight pounds of seed. The time occupied by the Victor in this rethreshing was seven minutes less than that occupied by the Birdsell.

These machines were both run by a Russell engine, from Massillon, Ohio, in charge of John F. Fallon; used essentially the same amount of power.

E. SIXBY, Chairman, LaGrange, Ind.  
J. H. GARDNER, Sec'y, Centerville, Mich.

## First Premiums at all Competitive Trials.

Railway, Chain and Lever Horse Powers. Threshers and Cleaners, Threshers and Shakers, Clover Hullers, Feed Cutters, Wheel Horse Rakes, Corn Cultivators, Horse Fitchforks, Shingle Machines, Straw, Threshers, Portable Steam-Engines, Cider and Wine-Mills and Presses, Dog and Pony Powers, etc. etc.

**WHEELER & MELICK CO.,**  
ALBANY, N. Y.

Send stamp for circular and report of Centennial trial.

## CIDER

Can be kept for years

## SWEET

As when pressed by using *Cord's Cider Preservative* it absolutely prevents fermentation; is simple, cheap, and healthful; far ahead of any other process; convincing testimony sent to the *Domestic*. Package for 2 cts., 50 cts.; for 7 lbs., \$1, with full directions for use by mail prepaid. Address FRANK FORD, Ravenna, Ohio.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from Page 339.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

**The German Edition.**—All the principal articles and engravings that appear in the *American Agriculturist* are reproduced in the German Edition. Besides these, there is a special department, edited by an eminent German cultivator. Our friends can do us a good service by calling the attention of their German neighbors and friends to the fact that they can have the paper in their own language, and those who employ Germans will find this Journal a most useful and acceptable present.

**Bound Copies** of volume 38, and of every previous volume back to Vol. XVI. (1857), neatly bound, with gilt backs, Index, etc., are supplied at \$2 each (or \$2.30 if to be sent by mail). See Publishers' Notes, 2d cover page.

**Clubs** can at any time be increased by remitting for each addition, the price paid by the original members; or a small club may have a larger one at reduced rates, thus: One having sent 6 subscribers and \$7, may afterwards send 4 names more and \$3, making 10 subscribers for \$10.00; and so for the various other club rates.

**Terms to New South Wales, New Zealand, Australia, Africa, etc.**—To several inquirers. Under the latest revision of the Postal Union Regulations the price of the *American Agriculturist* (either English or German edition), including postage prepaid through, will be covered by 7 shillings sterling per annum. This applies to the above countries, and to all others embraced in the General Postal Union. The simplest mode of remittance is by Postal Money Orders, payable in London, to the order of Orange Judd Company. These can be readily cashed in N. Y. City at a slight discount, which the publishers will cheerfully pay. For Club rates, (postage included), see our second cover page, and reckon 22 cents to the shilling sterling.

## "Smut Grass," Indian Drop-Seed Grass.

—This grass, *Sporobolus Indicus*, and *Agrostis Indica* of the older works, appears to be common from North Carolina southward. The flowers are often ergotised, and as the fine spores blacken the hands, or whatever else comes in contact with them, it has received the popular name of "Smut Grass," and in some places is known as "Black-seeded Grass." If any of our friends have had experience with this as a pasture or lawn grass we shall be glad to hear from them in regard to it.

**Chisel Handles** are very apt to be spoiled by splitting down when improperly struck with the hammer or mallet. This trouble may be avoided by putting a piece of heavy leather around the upper end as a ferrule, fastened in place by a few small tacks. When a mallet is used the leather ring is better than an iron one, as the mallet is not beaten out of shape by the leather as it may be if there is an iron ring on the handle.

**A Large Horse.**—One of the largest horses ever seen in New York City, recently arrived from Ohio. He is 20 hands and one inch in height and weighs 2,450 pounds. The animal is of "native" stock and is a dark bay, of fine proportions and appears in perfect health.

**Are Lombardy Poplars Injurious?**—"J. M. W." Pontiac, Ill., asks if Lombardy Poplar will injure fruit trees and prevent them from bearing. Most decidedly, provided it is planted where its roots can extend and rob the fruit trees of the nourishment that their roots ought to take up. And so with any other tree.

**Handsome than Silver Plate.**—Some quite novel were recently attracted our attention, and we learned that it was a "Granite Tea Set," a new premium for 1881 with other articles, brought to the office to have engravings made for the Premium List. There were, be-

## La Dows Jointed Pulverizing & Smoothing DISC HARROW.

Being jointed in the center, is adapted to both smooth and uneven surfaces. Acknowledged the best of the kind, and will pulverize and cover seed better in one operation, than going over twice with others. Made with both Chilled Metal and Cast Steel Discs polished. Send for circular and price list. Manufactured by

**WHEELER & MELICK CO.,**  
Albany, N. Y., for the United States.

By EVERETT & SMALL, Boston, Mass., for the N. E. States, and by Budlong & Co., Aurora, Ill., for Ill., Iowa, Wis., Minn., Neb., Kan., and Mo.

## MILL MANUFACTORY

ESTABLISHED 1851.

## Grist Mills of French Buhr Stone.

Portable Mills for Farmers, Saw Mills, etc. 18 Sizes and Styles. Over 2,000 in use. \$30 and upwards. Complete Mill and Shelter \$95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mill. ALL SIZES. Send for Circular No. 28. **NORDYKE & ARMON CO.,** Indianapolis, Ind.

**EMPLOYMENT—LOCAL OR TRAVELING**  
State which preferred.  
Also SALARY per month. All EXPENSES advanced. WAGES promptly paid. **SLOAN & Co. 306 George St. Cincinnati, O.**

## Hardy Perennial Plants

Are increasing in popularity because they are Hardy, their roots living through the winter—and Perennial, appearing year after year in the same place. They include the most beautiful kinds that bloom all through the season, from earliest spring to latest fall. Autumn is in many cases the best season for setting out these plants. Send for free descriptive Catalogue of the largest collection in the Country—including Hardy Climbers, Flowering Shrubs, Lilacs, Philoxes, Ferns, etc. Also choice native plants. **WOOLSON & CO., Box 180, Passaic, N. J.**

sides the usual pieces of a "Tea Set," a Coffee Pot, Water Pitcher, and Butter Dish, all of pleasing design, as may be seen by reference to the Premium List. What especially interested us, was the material of which these were made, which appears to mark a new step in the way of art manufactures. The basis of these wares is iron—good honest sheet iron—here we have utility; in design and finish we have elegance. The larger portion of the surface of the articles is covered with what is called "Perfection Granite Coating," which is really an enamel, or glaze, the material being applied and fused by intense heat to form a beautifully smooth surface. The term "Granite," chosen as a trade mark, hardly gives a correct idea of the appearance of the ware, which is more like that of the finer kinds of bluish marble than granite. This peculiar mottled surface is relieved by having bands of nickel plate, and the handles and various other parts are also in nickel. The "beauty" of silver-plated ware "is but skin deep," and that skin is often fearfully and wonderfully thin. The merest film of silver looks at first as well as honestly made plate, and the quality of such wares can only be judged when one knows who made them. But there is about this "Granite" ware an honest look that is very satisfying. Nickel does not pretend to be silver, being handsome enough in itself, and is not so dear that a good thick coating may not be applied. In fact the ware is a thing of itself, and is not open to the suspicion of trying to appear like silver or like anything that it is not. The manufacturers, Manning, Bowman & Co., New York, are to be congratulated upon this most satisfactory application of art and manufacturing skill to the common articles of household use.

### Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, from our record kept daily during the year, show at a glance the transactions for the month ending August 10th, 1880, and for the corresponding period last year:

#### 1. TRANSACTIONS AT THE NEW YORK MARKETS.

RECEIPTS.	Flour.	Wheat.	Corn.	Rye.	Barley.	Oats.
27 days 1880.	407,000	7,864,000	5,878,000	63,000	2,900	926,000
27 days 1879.	402,000	3,696,000	4,931,000	813,000	815,000	1,293,000

78,150,000	27,101,000	18,239,000	2,564,000	1,515,150	2,086,000	0 3/4, 100

Dealings in Stocks and Bonds have been free for the season of the year, and though values have fluctuated widely, the market has shown an upward tendency.... Money has been in liberal supply, at comparatively low figures, in the loan and discount line.... Real Estate has been held with increasing confidence.... A moderate degree of animation has been reported in the line of General Merchandise at variable prices, though closing, as a rule, stronger.... Less inquiry has been noted for Cotton, which has declined slightly. Crop prospects are represented as very favorable.... A moderate demand prevailed for Wool, prices of which tended to weakness and irregularity. Manufacturers have been buying with reserve.... Hops have declined sharply on freer offerings and a restricted call for supplies. A few bales of the crop of 1880 have been received and placed to brewers within the range of 50¢ @ 75¢.... More activity has been noted in Petroleum, which has been ruling higher, and Naval Stores have attracted rather more attention, closing more firmly.... Tobacco has been quoted steady, on a moderate movement.... In the Bread-stuff line, transactions have been on an extensive scale, but unsettled, and for grain generally much lower, figures. Wheat has been offered with more urgency, especially new crop Winter, leading to a severe break in values, which in turn served to quicken operations, partly on speculative account, and at the close sellers again had the advantage. Corn fell materially early in the month, but left off stronger on liberal dealings largely for export. Cable advices have been encouraging. Rye has been quiet at irregular rates. Oats have been in light stock and wanted, partly for contract purposes.... Flour has been moderately active, closing in favor of buyers.... Provisions have been more confidently dealt in, and have been quoted dearer, though unsettled.... Ocean Grain freights

have been less active, opening higher but closing lower including by steam to Liverpool, 84¢ @ 84¢. per bushel; to Bristol, by steam, to 92¢. per bushel; to Antwerp, by steam, to 84¢ @ 92¢. per bushel, and sail to Cork, for orders for vessels of average carrying capacity—say 3,000 to 4,000 qrs.—6s. 1 1/2¢ @ 6s. 3d. per qr. of 480 lbs.... The visible supplies of Wheat—embracing the hoards at lake ports, in transit, and on the seaboard—at latest dates, embraced about 14,272,000 bushels; of Corn, 16,739,600 bushels; of Rye, 271,900 bushels; of Barley, 176,200 bushels, and of Oats, 1,516,400 bushels, against on January 31, an aggregate of 30,100,000 bushels Wheat, 13,100,000 bushels Corn, 979,000 bushels Rye, 4,155,000 bushels Barley, and 3,080,000 bushels Oats.

Prices for beesves the past five weeks were as follows: WEEK ENDING Range. Larger Sales. Aver. July 11 8 1/2 @ 10 c. 8 1/2 @ 9 c. 9 c. July 19 8 1/2 @ 10 c. 8 1/2 @ 9 c. 9 c. July 26 7 1/2 @ 10 c. 8 1/2 @ 9 c. 9 c. Aug. 2 7 1/2 @ 10 c. 8 1/2 @ 9 c. 9 c. Aug. 9 6 @ 10 c. 8 1/2 @ 9 c. 9 c. Beesves.—The month closed with a dull and discouraging cattle trade. There was a falling off of over a thousand head in the last week. The export trade is

not what it was at the beginning of the month, when the receipts were heavy and the market active. Corn fed Colorados brought 81¢ @ 9c. and as high as 10¢. was paid for extra selected Illinois steers to dress 57 pounds.... Cows.—There is a very light demand for milch cows, and the arrivals, though small, are all that are wanted. State cows sold for from \$30 to \$50.... Calves.—The market for veals has been fair. Grassers and Buttermilk calves sold at 2¢ @ 3¢, and a few select lots at 8c. Fed calves were at 3¢ @ 4¢.... Sheep and Lambs.—As usual at this time of year, prime stock has been in demand at good prices, while common stock has been hard to dispose of at low prices. Poor to fair sheep sold at 2¢ @ 4¢, and Prime at 4¢ @ 5¢, and a few select at 6c.... Swine.—Market active at the close of the month. Common grassers sold at \$4.25 @ \$4.50. Fair to good Michigans and Ohios \$3.55 @ \$3.85. Corn fed Yorkers \$4 90 @ \$5.05.

The Horse Market.—The receipts of horses have been very light and this is fortunate as the demand is small. The present supply is mostly common light horses which sell for \$100 @ \$140 per head. A number of importations of valuable blooded horses have been made, mostly of the Norman Percheron and Clydesdale breeds. These heavy horses will mostly go to the Western States.

#### Prices of Feed.

Cotton-seed meal	per ton	\$30.00
Lined-cake meal	"	27.00
Middlings	"	24.00
Brans	"	23.00

Gysnuut, Nova Scotia, ground, per ton	24.00

Long Ladders are the most easily moved to any considerable distance upon the farm by strapping them upon a wheelbarrow, the rear end being used as the handles, by means of which the whole is trundled along. The entire ladder is before the person, and there is no danger of doing any injury to surrounding objects, as is the case when carried upon the shoulder.

A Deaf Shepherd Dog.—"L. B. M.," Tecumseh, Neb., has a dog which occasionally has a gathering in, and matters comes from his ear; at such times he is deaf and unable to work, while he is all right at other times. The trouble seems to be what is known as Internal Canker of the Ear, or, as physicians term it, *Otorrhea*. Warm fomentations would be of benefit, and attention should be given to feeding at regular intervals, a moderate allowance of wholesome food. Pour into the ear once a day, a teaspoonful of lotion made of half a dram of Sugar of Lead, and one dram of Tincture of Arnica, in half a pint of water.

Good Shooting.—The victory of the American team at Dollymount, with a score of 1,292 against 1,280 for the Irish competitors shows that rifle shooting is getting to be a very skillful practice. Of the 430 shots fired at the 800, 900, and 1000 yard ranges, but a single one would have missed a man, had he stood in place of the target. To seldom miss a man at over half a mile certainly might be made very dangerous shooting.

The Chinese Yam.—"S. K." This is perfectly hardy, and is worth growing as an ornamental climber; its leaves are of a fine dark green, and its flowers, though minute and not showy, are pleasingly fragrant.

Lunch for the Team.—A Lunch at a fence corner, or from the end of the wagon box, under a tree, is much enjoyed by the team, and the time thus spent is not lost, but more than made up by the freshness with which the animals go to their work again. There are many times when the team of oxen or horses must stop work, and wait while some other matter is being attended to by the driver, and a half hour, or less, spent at lunch, will go far to keep the working stock in good condition through the season of heat and hard work. The same may be said of occasional light drinks if the water is not too much out of the way to allow them to be given.

**The Texas State Agricultural and Mechanical College,** is preparing for active work. It has made an excellent move in the right direction in the appointment as Professor of Agriculture and Horticulture, Mr. C. C. Georgeson. Professor G. graduated a few years ago at the Michigan Agricultural College, and has for some time been engaged upon the "Rural New Yorker," of this City. Mr. G. is one of the coming men in the agriculture of this country, and will in his new position find a much wider and more congenial field of usefulness than he has heretofore occupied. From our knowledge of Prof. G. we can cheerfully commend him to the favorable consideration of our Texan friends. We shall be disappointed if he does not in time show the wisdom of the appointment, by rendering essential service in the development of the agriculture of that large and most beautiful State.

**Rabbits Not Wanted.**—Several months ago, we suggested that those who had choice rabbits for sale should make the fact known. It had reference to Lop-eared and Angora breeds, and as a hint to dealers who had these for sale to advertise them. Parties continue to write us that they have choice common rabbits for sale. We do not wish to buy rabbits.

**How to Kill a Beef.**—Intelligent butchers understand that the quality of the beef is influenced by the manner in which the animal is killed. Prolonged torture promotes secretions which are injurious to the flesh. In the large slaughter houses the method of *putting* is now generally introduced and consists in piercing the posterior part of the brain with a sharp instrument called a *spud*. The operator, who must be a very cool and experienced one, stands upon a platform above the cattle and thrusts the spud into the brain; the animal falls and is insensible in an instant. This humane method is not practicable for farmers who have few animals to kill during the year. In killing in the ordinary manner the object is the derangement of the brain, as this is the seat of consciousness, and therefore of sensibility to pain; consequently the blow must be directed at the brain. For heaves the exterior point to be struck is the intersection of the two lines joining the base of the horn and the opposite eye—a point above and not between the eyes. The blow may be by either a bullet, an axe, or hammer. If the butcher is a good shot, he may use the rifle, otherwise the heavy hammer or axe. The head of the animal being first securely fastened and then blindfolded, a single blow of either bullet or hammer should be sufficient; after which the throat should be cut and the bleeding accomplished.

**Care of Root Crops.**—A good crop of roots can not be expected without the ground is kept clean by frequent cultivation. Many farmers prepare the ground properly and sow the seed with care, and then leave the young plants to strive against the weeds as best they may. Such work can not pay; careful preparation must be followed by clean culture. An outlay of \$5 or \$10 in weeding and hoeing, may very easily make \$25 to \$50 difference in the crop; in fact it may make the difference between a crop of roots and a rank growth of weeds that cover the ground and fill it with foul seed. If roots are to be grown we must help them by keeping out the weeds. No other way will be successful.

**"Blanketed" Cattle.**—"J. S. B." These cattle were imported into this country many years ago. They are excellent milkers and are found in herds in Orange and other counties in New York. Several names have been given them such as "Belted," "Sheeted," "Draped," etc., all founded on the leading characteristic—a broad belt of white passing around the middle of the body, while the front and rear portions are black. This peculiar and quite constant and uniform marking makes these herds particularly striking to the eye, as they feed on the meadows and hillsides. In Holland, from which our "Blanketed" Cattle came many years ago, this breed is highly esteemed by many and preserved with care.

**Log Drains,** that will last for several years, may be made, but they should be laid down only when other kinds are out of the question. The ditches for them are

dug in the usual manner and the logs placed in the bottom so as to make a throat or water channel. Two logs are placed along the sides of the bottom, and the third rests upon these two, the side logs being kept apart by the pressure of the middle one. Brush or sods should be put in, to fill any small spaces between the logs, when the ditch can be filled. Such drains are of special value in newly settled regions where logs are the only materials at hand for the drains that must be constructed at once.

### The Adjustable Folding Camp Chair.

When we came across the chair described on page 317, last month, at the house of a friend in the country, we looked in vain for the name of the maker. Knowing that devices not one tenth as useful and sensible were patented, we were surprised not to find either the customary "Patented," or "Patent Applied for" anywhere upon the chair. All that our friend knew about the chairs was, that he had bought them of some one who offered them at his office in the city. It now appears that the chair was patented, but that some one without proper notions of right and wrong had copied the design and made and sold the chairs. The chair is patented by Gifford & Bates, and is sold by A. W. Moorehouse, No. 242 Canal St., who, when he discovered the error, informed us of the real state of the case in a manner that makes it a pleasure to correct the mistake. No matter

AN ADJUSTABLE CAMP CHAIR.

how much we may try to avoid them, such errors will occur, and all we can do is to state the fact, that the article is patented, and that no one has a right to make a chair of the style referred to, without the permission of the owner of the patent. There is a very common impression that any one can make a patented article for his own use, without reference to the patentee. This is a mistake. No one has a right to make a patented article for his own use, and he has no right to use one that another person has made in disregard of the patent. As to the chairs in question, our good opinion of them is increased after seeing those made by Mr. Moorehouse. The chief fault of those we first saw was, that they were just a little too narrow; while Mr. M.'s have ample width; they are moreover much better finished. The engraving given last month gives an idea of the plain style for the lawn, veranda, or camp, but some are made for the house which are as elegant as they are convenient and comfortable. We give an engraving of one of the more highly finished chairs, which has the wood work in ebony finish, relieved by a little gliding, while the back and seat, instead of duck, as in the others, are formed by a piece of Brussels carpet. The chairs fold up in the most compact manner and only occupy the thickness of one side piece, allowing of very close packing either for transportation or storing away when not in use.

**Protection of Soils in Winter.**—Some French physicists have been recently making some extended experiments upon the temperature of soils during winter. They have found a striking difference between the temperature of soils covered with grass—a sod—and those that had their upper surface exposed directly to the air, the sod most effectually protecting the soil from the

action of frost. In the case of snow, it was found to be an excellent screen against changes of temperature—its value as a "blanket" is more as an equalizer of temperature, preventing sudden changes on account of its poor conducting power than to keep out the cold. A thick sod or a mulch of leaves of the same thickness, is better protection to the soil and living plants than snow.

**Feeding from the Hand.**—It is remarkable how gentle the farm stock may become by kind and considerate treatment. Take, for example, calves at this season of the year; an occasional handful of meal, fed to them from a dish, will do them a double good; it will aid in their growth and make them easier to handle when they become older. The custom of carrying some salt to the sheep every time one goes to their pasture, though it may not do them much good, pays in the gentle disposition which it develops in the flock. Little acts of kindness are not forgotten, even by the dumb animals.

**The Most Science Thing.**—The talk of the venders of various wares along the city streets is sometimes quite amusing. One with a peculiar top a few days ago in front of our office thus presents its claims—"Here, sir, is the most science thing ever offered. I tell you there ain't nothing sold on the street so science as this."

**Bots in Horses.**—This trouble is due to the maggots or grubs of a fly which fasten themselves upon the lining of the stomach and sometimes that of the intestines of the horse. The female fly deposits her eggs singly upon the hairs of the lower jaw, neck, and forward legs of the horse. They hatch in a short time, and the tickling sensation produced by the young grub causes the horse to lick the place, and thus the grubs pass into the horse's mouth and from thence into the stomach, where they soon fasten themselves by numerous minute hooks in rows upon their white wrinkled bodies. After about two months the bots pass from the horse and bury themselves in the dung and remain in the dormant pupa state until the next season, when the fly begins the round of trouble again. The maggots irritate the coat of the stomach and cause the formation of pus, upon which they feed. There is no remedy for this troublesome parasite. A dose of physic may help to dislodge them, or hasten the time for their removal from the animal.

**"Oil Dropping from Trees."**—It is not oil; but instead a sweet, syrup-like liquid that exudes from the bodies of plant-lice (*Aphides*) which feed upon the younger portions of the trees. This "Honey Dew," as it is called, is frequently so abundant as to cover the ground, and the side walks in cities—where it is most frequently spoken of as "oil." Bees frequent such trees and gather the sweet exudation for the purpose of making it into honey. Ants are also fond of it and are often found in large numbers feeding upon the Honey Dew.

**Black Birds.**—"B. J. G." Nashua, Iowa, states that he keeps Black Birds away from the corn crib, by hanging around them pieces of bright tin, by means of wires in such a manner that they will swing in the wind.

**Lime as a Manure.**—There are direct and indirect manures; that is, substances which themselves contain and furnish the plants with essential elements of their growth, and others that only feed the plants by acting upon other compounds which thereby yield a supply of nourishment. Of this latter class is lime as it is generally used. A good dressing of lime may double the yield of wheat on a field—not any and every field, but on some fields.—Now, why is it, that it will produce this remarkable increase on some fields, and that too when there is already sufficient lime in the soil to furnish all of that mineral needed by the growing crops for a score or a hundred years to come? The soil on which the lime has such a powerful influence, abounds in undecomposed organic matter; the lime decomposes this matter and those compounds that are needed by the growing plants. It is principally to the nitrogen compounds set free that the increased production is due. The lime was the indirect cause of the greater growth.

**Gather the Leaves.**—The leaves that fall from the trees in autumn may be turned to good account if they are gathered and used for litter in the stables. They furnish an excellent absorbent for liquid manure and are of themselves a valuable fertilizer, as they contain large per cents of potash, phosphoric acid and other essential elements of plant food. To gather the leaves rapidly a long-headed rake provided with stout teeth should be used, and the leaves loaded into a cart or wagon, and taken to a place where they may be kept dry and handy for use. Besides the direct value of the leaves, the raking of them from the door-yard, for example, gives it a neat appearance, when it would otherwise look ill kept.

**Ventilator for Root Pit.**—In pitting roots, openings should be left for the escape of the moisture that will rise from the heap of roots. If such openings are not provided the vapors will accumulate and decomposition will soon begin, and in a short time the roots will be rotten. A simple opening at the top of the pit, or at intervals along the ridge, if the heap is one of considerable size, is not sufficient. The ventilator should run down into the heap, even to the bottom. Such an one can be made by tying three or four short rails together, and setting them in the ground before the roots are deposited. The rails should project a few inches above the top of the pit, after the covering of earth has been put in place. A layer of straw may be put over the top of the ventilator to keep rain from running in.

**Pear Seed.**—"T. G.," Cobden, Ill., asks how to preserve pear seed so that it will germinate in spring, stating that he tried keeping it in sand over winter, but it failed to grow. As our correspondent does not state just how he kept the seeds in sand, we cannot suggest where the trouble is. If the pear seeds are mixed with sand that has a little moisture that it will not stick together when squeezed, and the seeds when mixed with it kept in a place where the temperature is uniform and cool, but not freezing cold, we think he will have no difficulty with their germination.

**A Precocious Calf.**—"J. T.," Baltimore, Md., writes that he has a grade Jersey heifer calf, which has never seemed to care much for milk, but has a marked preference for grazing. The calf ruminated when but two days old and has continued to do so, the cud coming and going with all the regularity of an experienced cow. He asks: "is not this very remarkable?"—It is, or perhaps we may say would be, with any breed but the Jersey. These animals have been long bred to be precocious; they come to maturity at a very early age, and this chewing the cud so young is but one manifestation of the general precocity of the breed.

**The Teeth.**—"G. M. B.," Sterling, Ill., referring to something said in the "Household," on the care of the teeth, gives his own method, adopted by the advice of a skilled dentist. The teeth having been properly cleaned and the incrustations of tartar removed by a dentist, he every night thoroughly washes the teeth inside and out by using a lather made from White Castile Soap, applied by means of a swab, made by tying a bit of fine, soft sponge to a stick of convenient length. Soap is an excellent application, and in most cases nothing more is required to keep the teeth in perfect order. Some of the best of the dentrifices sold at the shops, consist largely of powdered soap.

**"Slugs" on Pear and Cherry Trees.**—The greenish, slimy, leech-like insect, often so common on fruit trees, especially on the cherry and pear, is generally called a "slug." It is, however, a proper larva, or grub of a small, shining black fly—*Selandria cerasti*. The sprinkling of fine quicklime, or fine dust has been found effective. "J. A. B.," writes from Philadelphia, that he finds White Hellebore, mixed with water, as advised for currant bushes, perfectly successful in killing the slug. There are two broods, a late one in September usually succeeds the one which comes in June.

**About a Hay Sweep.**—An implement drawn by two horses to gather up a windrow of hay easily and rapidly has long been in use. Having several letters asking us to describe such a sweep, we reproduced in May last an engraving given in Thomas' "Farm Implements." We now learn from J. E. Potter, of Ottawa, Ill., that the Sweep in question conflicts with a patent which he holds. Mr. P. sends us a copy of the specifications, from which it plainly appears that one can not construct a Hay Sweep according to the design of that given in May without infringing upon the patent. Of course, had we had any idea that the Sweep had been patented, we should have had more regard for the rights of others than to publish it, but as the book referred to said nothing about a patent, we assumed that, like many other things it illustrates, the design was common property. We take all possible care to respect the rights of

inventors and patentees, and we have too much regard for the interests of farmers to knowingly lead them to violate these rights. It is but just to say that Mr. Potter, who holds the patent, takes a very fair view of this matter, as he sees that it was through inadvertence on our part that we gave the Sweep as unpatented. Farmers disposed to build a Sweep after this pattern are now informed that they have no right to do so without first corresponding with Mr. Potter, whose address is given above.

**Tips for Children's Shoes.**—If a boy does not wear out the toes of his shoes, he must be a very quiet youngster and not have much "go" in him. Ragged shoes with the toes in sight are not pleasing to the sight of the parent, but we had rather see them than the well kept shoes of the boy who has not vim enough to play and wear out the toes. But we can now have both—lively boys and whole toes. At one time the use of copper tips to shoes were quite common, but boys never took to them kindly; perhaps they seemed too much the mark of the naughty boy. At any rate, this objection is removed by the Black Tips, advertised in our columns. These will protect the toes as well as the metal ones, and being black, like the leather, are not conspicuous.

**Grapes from a Raisin Seed.**—This time the vine grew at Huntsville, Alabama. Miss R. M. Lowery planted the raisin seed in the spring of 1875, and in the summer of 1880 Mr. Lowery brought us several of the 120 bunches it bore. Raisins are made from the European grape, and the sample brought us was as genuine an American as the Concord. This is but one of many instances in which we have seen American grapes which the raiser sincerely believed to have come from a raisin seed. It is much easier to suppose that the raisin seed did not germinate, and that a seed which was in the soil did, than to believe that a European grape seed could produce such a widely different fruit as the one shown us.

**The Cactus.**—"A. W.," Phoenixville, Pa., asks how to cultivate "the Cactus," but as he adds that he has several varieties, he no doubt means plants of the Cactus family. These plants flower, then make their growth, during which they need water like other plants. When the new growth is mature, the plants go into a state of rest, in which they require little or no water, but the earth may become quite dry. When their season for blooming comes around again, the plants are given water gradually at first, and more as their buds swell, and they go through the same round of blooming, active growth, and rest as before. So far as those in general cultivation go, there are two classes, the winter and summer bloomers. The Epiphyllums, or Crab's-claw Cactuses, are the chief winter bloomers, coming into flower in early winter, and consequently have their season of rest, or drouth, in summer. On the other hand, the large and brilliant flowering varieties of which the old *Cereus Speciosissimus* is a familiar example, can rest in a dry state anywhere if not cold enough to freeze them, and are brought into bloom in summer. The larger number of the common varieties belong to this class, and it is useless to try, as many do, to bring them into bloom in winter.

**Net-work Wire Fences.**—Our readers have seen by articles given some months ago, what a wonderful variety there can be in fences made merely of horizontal strands of wire stretched between posts. But the use of wire in fencing has by no means been exhausted in these styles. The Sedgwick Steel Wire Fence is upon a very different plan: this is a net-work of wire, with diamond-shaped meshes, presenting really a coarse lace-work woven of steel wire. Formerly, like lace, this network was made by hand, but the invention of machinery for weaving it has greatly reduced the price of the network, and increased its uniformity and excellence. Not only are fences made of the net-work, but gates are of the same material. A fence of this kind not only serves to keep in—or out—the larger domestic animals, but the mesh is so small that dogs, pigs, and poultry find it an effective barrier. Besides its use as fencing, the network will serve other purposes, such as building arched trellises for vines, etc. The neat appearance of a net-work wire fence, as well as its utility, commends it.

**The Cornell Experiment Station.**—Cornell University has published a report of the agricultural experiments that have been made there, and we are informed that it may be had by remitting 30c.—which covers the cost of publication and postage—to Prof. W. R. Lazenby, Ithaca, N. Y.

**Gathering Pumpkins.**—There are probably more liberties taken with pumpkins than any other product of the farm. It may be because they usually grow amongst the corn, and seem to have no place given them by themselves, that they have so few rights that the farmer, and especially the farm boy, is bound to respect.

The pumpkin is a valuable product of the farm, and is well worthy of careful harvesting and economical feeding. When the corn is cut, there is a large knife in the cutter's hands, and a fine, smooth-faced pumpkin is a tempting object to slash into. Yes! a pumpkin is a fine object to sit down upon to rest, and then the knife is again used to make all sorts of scratches, gashes, etc., and the sitting frequently ends in the destruction of the seat. The pumpkins that escape the corn-knives are either left in the field through the hard frosts, or are drawn to a fence corner, where they are left in a pile, exposed to rain, snow and frost. When they are gathered, a fork is most frequently used, and every pumpkin receives from one to half a dozen thrusts and other bruises, so that decay must soon set in and destroy what is left. If pumpkins are worth growing, they deserve care in harvesting. If left alone when the corn is cut, and gathered before the frosts come, being put under cover without using a fork, the pumpkin crop will pay a far greater profit than it does now upon many farms.

**Canning Green Corn.**—Each year we are asked to give directions for preserving green corn in cans, and each year we are obliged to say that we know of no successful method other than that practised at the canning factories. This requires tin cans and the use of the soldering iron; and only those who can solder can put up the corn. The points to be observed are these: The best and sweetest corn, in just the right state for the table, is picked and used at once. The cannery use a bent knife to cut it rapidly from the cob, and some have a machine for the purpose. The corn is cut from the cobs, and packed closely in the cans. The cobs are put into a boiler, covered with water, and boiled for about an hour. This liquid is used to fill the spaces among the kernels in the cans, enough being used to cover them, and, unless the corn is very sweet, a teaspoonful of white sugar is added. The caps of the cans are then soldered on, each cap having a small vent-hole pricked in its center. The cans being soldered, the next step is what the cannery call "processing," which is to boil the cans in water. A wash boiler, or any convenient kettle can be used; it should have at the bottom a rack made of strips of wood, on which to set the cans. The cans of corn are put in the "processing" kettle, with the vent-hole open, and are boiled briskly for two hours. They are then lifted out, one by one, using tongs made for the purpose, setting each down with a sharp rap, to knock down any corn that may be upon the inside of the cap. The cover is then pressed in as much as possible, and the vent-hole stopped by a drop of solder. The cans are then returned to the kettle, and boiled for four hours longer. Operators differ as to the time of "processing," some of them making it a secret, but from 6 to 8 hours in all seems to be necessary for corn.

**Horticulture in the Mississippi Valley.**—A large number of the wide-awake horticulturists living in the Valley of the Father of Waters, have formed a preliminary organization, with a view to complete the formation of a Horticultural Society on the 8th of the present month. In this month there will be held an exhibition at St. Louis, Mo., beginning on the 7th, and continuing for three days, at which numerous premiums are to be awarded, and these are so liberal that they can not fail to call forth one of the finest collections of fruits, flowers, etc., ever seen in this country. All, without regard to locality, are invited to contribute. Those who have never seen the fruits grown in this western country, should take advantage of this exhibition, as it will give them new ideas of fruit culture, and impress them with the wonderful possibilities of our wide country. Fruit for the exhibition may be forwarded to N. J. Coleman, St. Louis, Mo., care of St. Louis Fruit House, 703 South Third St. The Laclede Hotel, corner of 5th and Chestnut Streets, will be the headquarters of the Society, and make reduced terms to members.

**Salting Pickles.**—The pickle factories buy the cucumbers from the growers, and salt them in large vats. Those who raise cucumbers at a distance from factories salt them in barrels. Barrels for the purpose must be tight and clean; whiskey and alcohol barrels are usually the best. Half a bushel of the best salt is required to the barrel, though some growers use less. A head is removed from the barrel, and a layer of cucumbers put in, with some salt sprinkled among them. A board follower is placed on the cucumbers, and water enough added to completely cover them. The next day, more cucumbers are put in, and so on until the barrel is full. If enough are picked in one day, the matter is very simple. Fill the barrel with cucumbers, sprinkling in the salt, and head up tight. Then fill the barrel with water through the bung-hole, and bung up tight. Where there are not enough picked to fill a barrel, then they must be added to from day to day, taking care that those already in the barrel are kept covered with the brine, using stones as weights to keep the follower down upon them.

**Keeping One Cow.**—The three admirable prize essays on this subject have been published in our pages, and many will be glad to have them together in a more convenient form. There were in many of the other essays hints of great practical value, and in some cases these were very full upon points in which the prize articles were deficient. In order to present the whole subject, the prize essays and copious extracts from the best of over sixty others have been brought together in a bound volume of 144 12mo. pages. The work is well illustrated, contains editorial explanatory notes, and presents in a neat and compact form the most complete and latest information upon the best method of treating the family cow, in order to make her as useful as possible to the family. Published by the Orange Judd Company, and will be sent post paid, by mail, for \$1.

**Young Men in Horticulture.**—From time to time we have had letters from young men with tastes for horticultural pursuits, asking where they could go for instruction in the propagation of plants and other matters relating to plant culture. Generally we have not been able to aid such applicants, but at present we know of an opening where the proper applicant can receive such instruction. Address "Horticulturist," care of the Editor of the *American Agriculturist*.

**Unprofitable Animals.**—As the season draws to a close, the farmer should know enough about his farm animals to be able to cull out any that have not been profitable. If a poor cow has been in the dairy through the summer, he should now decide to not keep her another year, and begin to fatten her for beef. In the same way the flock of sheep may be improved by "weeding out" the inferior animals, allowing only the good, profitable ones to reproduce their kind. By thus culling out inferior animals the stock of the farm will be continually improved; while by breeding only from the best, and keeping only those animals that pay, much may be done to raise the standard of all our domestic animals.

**Getting Rid of the Elder.**—"W. J. M.," Washington, Pa., finds the common Elder troublesome in his fields; he has tried grubbing and cutting with no effect, and asks how he can get rid of it. There is no specific for destroying shrubs when they appear as weeds, any more than there is for herbs. We must follow that course that will kill them, and that is usually "grubbing and cutting," which, if persevered in, will conquer in time. Grub up the larger clumps, and mow off the shoots that start from the smaller ones, and from the roots left in the ground. Once or twice cutting may make no visible impression, but keep at it, and mow as often as any green shoot appears, and if the mower does not tire and give it up, the shrub will. Sheep are often most useful aids in exterminating shrubs. We do not recollect whether they will eat the strong-smelling foliage of the Elder, but if they will, keep them on the patch by means of a portable fence, and they will render essential service. The fact that shrubs, if cut at midsummer, make a new growth with less vigor than when cut earlier, has given rise to a notion that there is a proper "time of the moon" to cut shrubs—and so there is. When they are cut, it is always done in just the right time of the moon.

**Coal-Oil Barrels.**—Some months ago we asked those who had succeeded in rendering barrels which had held kerosene or petroleum fit to use for cider or vinegar to give us their method. It is rarely that we have had such a number of replies to a like question, they having come by dozens and scores. We thank all who have thus responded, and would say that while a few have advised burning out the barrels, by far the greater number have found that soaking in water will answer. Some advice immersing the barrel in a stream, but the majority of those who have written us find that filling with water, and allowing the barrel to soak for several days, occasionally changing the water, accomplishes the object.

**White Hellebore and Paris Green.**—"E. H. S.," Titusville, N. J. Neither of these poisons can be substituted for the other in treating Currant Worm and Potato Bug. Hellebore will not kill the beetle, and while Paris Green will no doubt kill the Currant Worm it is unsafe to use it on anything that is to be eaten. White Hellebore has been used for many years and by some who grow currants largely for market. We have not heard of a single case in all this time of any injury resulting from eating fruit that had been treated with it. The quantity put upon each bush is small, and even if the fruit had sufficient on it to be perceptible, it would be regarded as soiled and either rejected or washed. It would not be possible for one to eat enough to do serious injury without finding it disagreeable to the taste; the first effect of a moderate dose is to cause vomiting. We can not see that one can possibly be injured through its use on currants, or we would not recommend it.

## Bee Notes for September.

The general honey yield is now over in most localities, and the surplus honey that still remains in the hives should be removed at once. The practice of leaving boxes upon the hives after the honey season is over should be avoided. Remove the boxes and pack them away in a clean place where they will be ready for use the following season. Some of the boxes will be partly filled with honey, these, if they are single-comb ones, should have the honey removed by an extractor and the empty comb will serve as a guide the next season. The combs in the brood-nest need watching and if the moth-worm is found they should be smoked with brimstone. The preparations for successful wintering are to be made now. It is very desirable that each colony should be supplied with a large number of young bees as it goes into winter quarters. In order to obtain this end a prolific queen should be in every hive. Young queens usually deposit more eggs and for a longer time than old ones, and on this account are much to be preferred.

**MARKETING HONEY.**—Where the amount is small it may be disposed of with greatest profit in the home market. Larger quantities will, of course, be shipped to a city market—and provision for quick and safe transportation will need to be provided. A shipping case for box honey should hold from 10 to 25 pounds. It can be made of light basswood, nailed together. Before filling the cases see that each box of honey is as neat and clean in appearance as possible.

**EXTRACTED HONEY.**—Much of the honey is marketed as liquid or extracted honey. The forms in which it is put up are various. For small packages, quart glass jars are much used; larger packages may be either of tin, holding 10 to 20 lbs., or firkins holding 150 to 200 pounds.

## Nuts and Nubbins.

The little peach catches the early market. The most fatal grape-shot comes from the bottle. Many a property owner is poor in purse but rich in deed. The civil engineer would like to be monarch of all he surveys.

Our first parents got their suit if they were evicted from their houses.

You mustn't think a dentist is mad because you catch him grinding his teeth.

A fifty-dollar painted fan raises no more wind than the five-cent palm leaf.

The so-bet lady never sheds tears. She knows enough to keep her powder dry.

The report that the baby elephant was horn with a valise instead of a trunk is ludicrous.

"A prudent man," says a witty Frenchman, "is like a pin. His head prevents him from going too far."

A woman isn't fit to have a baby who doesn't know how to hold it; and this is as true of a tongue as of a baby.

"Penny wise, and pound foolish," soliloquized the man in church, and he put the penny in the box and the pound in his pocket.

The *Keokuk Gate City* wishes to know if a retired baggage-master can be appropriately referred to as the company's ex-checker.

It has been proved that after kindling his fire a miser stuck a cork in the nozzle of the bellows to save the little wind that was left in it.

Scientists claim that smoke injures the eyesight. But this is not true. The boy with a stump in his mouth can see his father ten squares away.

In concluding an article on the last corn crop an Alabama editor remarked "We have on exhibition in our sanctum a magnificent pair of ears."

"John, how many times have I told you always to eat bread with your meat?" "Papa, how many times have you told me not to do two things at a time?"

Teacher in high school: "Are *pro* and *con* synonymous or opposite terms?" "Scholar: "Opposite." "Teacher: "Give an example?" "Scholar: "Progress and Congress."

The brilliant Sophie Arnold, when she heard of a certain diplomatist that had been eaten by the wolves, exclaimed: "Poor hutes! Hunger must indeed be a terrible thing!"

An exchange says that a ton of gold is worth only about half a million dollars. We give this for what it is worth; our time has been taken up with politics, and somebody has hidden away the scales.

Smithington, who is forever reeling out the same old yarn, explains by saying that he has always heard that one story's good till another one's told, and he doesn't propose to spoil his by telling another.

When a census taker, wishing to compliment, said to a citizen: "Ah, sir, you've a wife of a hundred!" the lady grabbed a rolling-pin and sailed on him, saying: "You villain, I told you I was only 25. Don't you dare to put it down as 100!"

The cable informs us that "Tekke Turcomans at Dash-berd menace the line between Chatta and Tchikistlar." We have been tremblingly anticipating this news for months. War is a terrible thing. It develops hard feelings and harder names.

There was a man who had a clock. His name was Matthew Mears. He wound it regular every day for four-and-twenty years. At last his precious timepiece proved an eight-day clock to be, then a madder man than Mr. Mears I would not wish to see.

Later a gentleman sat down to write a deed, and began with: "Know one woman by these presents."—"You are wrong," said a bystander: "It ought to be 'know all men.'"—"Very well," answered the other, "if one woman knows it, all men will, of course."

"Goods at half price," said the sign. "How much is that teapot?" asked the old lady who had been attracted by the announcement.—"Fifty cents, mum."—"I guess I'll take it, then," she said, throwing down a quarter. The dealer let her have the teapot, but took in his sign before another customer could come in.

"My daughter, never tell any one your private affairs," said a mother in sending her daughter away upon her first journey. "Monsieur, a third class ticket, if you please."—"For where?" asked the employee.—"Is that any of your business?" answered mademoiselle, indignantly, remembering her mother's advice.

Chowder got a good dinner at home a few days ago by telling his wife that he was going to bring a judge home with him to that meal. When he arrived, alone, and Mrs. Chowder asked him where the judge was, he triumphantly pointed to himself, remarking: "I'm a good judge of a dinner." He will be obliged to get a dinner in some other way hereafter.

A little five-year-old girl of this city, who is receiving a kindergarten course in object lessons, was told by her teacher that the camel had four stomachs. Examining the hio-k representation of this beast of the desert a moment, to decide where he carried them all, the little one pointed to the hump and exclaimed, "Oh, mamma, and there's where he keeps them, don't he?"

One of those chaotic Nevada stories is thus briefly told by the *Virginia Enterprise*: "Yesterday, during the gale, while boulders as big as pumpkins were flying through the air, and water-pipes were being ripped out of the ground, an old Chinaman, with spectacles on his nose, was observed in the eastern part of the town, seated on a knoll, calmly flying his kite—an iron shutter, with a log-chain for a tail!"

## THE BELLE CITY FEED CUTTER.

The Best Feed Cutter in the World. The only one that runs light enough for Wind-Power.

Send for circular, references, &c. Name this paper when you write. DAVID LAWTON, Manufacturer, Racine, Wis.

2,803 Weight of two Ohio Improved Chester Hogs. Send for description of this famous breed, and Fowls. L. B. SILVER, Cleveland, O.

Catalogue Free. Biggest Bargain. A GOLD MOUNTED. Revolver for \$2.70. Made of the finest English Steel, Patent, Russian Model. Elegantly Engraved Rubber Handle, Blued Barrel. Uses Extra long .45 cartridge. Barrel length 7 in. Sent with box of cartridges, complete set of cleaning tools, for \$2.70 by mail for 20c extra. No more cheap quack and cheap imitations. We guarantee satisfaction. A better revolver cannot be purchased elsewhere for \$10. G. H. W. BATES & CO., Boston, Mass.

MARK'S PATENT FIRST PREMIUMS. Artificial Limbs, with Rubber hands and feet. The most reliable, comfortable and useful. Illustrated pamphlet of 112 pages, containing valuable information sent Free to those giving satisfactory description of their case. U. S. Gov't Manufacturer. Soldiers' attention specially invited. A. A. MARKS, 575 Broadway, New York City.

## THE CHAMPION WIND MILL POWER

The Best in the World.

It is perfectly self-regulating, and presents no unnecessary surplus to the wind. Frictioned by millwrights and mechanics to be superior to all other mills made. Do not buy until you have investigated the Champion. All information regarding the mill free.

POWELL & DOUGLAS, Waukegan, Ill.

**CAUTION!**—The great popularity of, and increasing demand for our "Automatic" Sewing Machine induces unprincipled agents to deceive customers by claiming, for their old pattern machines, automatic and other features belonging exclusively to us.

THE

# "New Automatic"

or "NO TENSION" Silent Sewing Machine

**Differs in all essential respects from every other Machine! Only Machine without a Tension, and Bobbin or Shuttle!—Only really Light-Running Machine!—Only Machine with Stitch-Regulator!—Easiest to Work!—Fastest!—Makes Strongest Seam!—Absolutely without Danger to Health!**

As it is impossible to convey by advertisement an idea of the unique and wonderful features of this Machine, we solicit **DIRECT CORRESPONDENCE** from all persons owning or about to purchase a Sewing Machine, and will carefully and promptly reply to all communications.

Address,

**WILLCOX & GIBBS S. M. CO., 658 Broadway, New York.**

## A Cure for Foot Rot.

### Best & Cheapest.

BUCHAN'S  
Cresylic Sheep Dip.

BUCHAN'S  
Cresylic Ointment.

Buchan's Cresylic Sheep Dip prevents and cures the scab and all parasitic diseases of the skin.

Buchan's Cresylic Ointment is CERTAIN DEATH to the Screw-worm or Grub.

For further particulars, send for price lists and circulars to KIDDER & LAIRD, 83 John St., New York.

University of the State of New York.

## American Veterinary College.

141 West 54th St. NEW YORK CITY.

The regular course of lectures commences in October, each year. Circular and information can be had on application to

A. LIAUTARD, M.D.V.S.,  
Dean of the Faculty.

## THOROUGHbred AND CROSS-BREED OR GRADE JERSEY STOCK.

5 fresh cows, 4 to 8 years old, with or without calves.  
5 thoroughbred Jersey Bulls, 1 to 5 years old.  
5 Heifers, 8 to 11 months old.  
All the above are, or can be registered in the A. J. C. Club Register. 25 cross-breed heifers and cows 2 to 7 years old. These are a mixture of the two breeds, Jerseys and Ayrshires; several are now fresh, and the balance within the next two months. The best family cows ever bred, all rich milkers and butter-makers; some of them 2 lb. cows, beautiful in form and colors. Orders solicited for calves of either breed, deliverable when weaned and ready to ship at 2 to 3 months old. My prices range from \$45 for a high grade heifer calf, to \$400 for my best thoroughbred cow and calf. April, 1880 THOMAS FITCH, New London, Conn.

## GENUINE COLLIE PUPS

Of proven excellence and remarkable beauty at lowest prices consistent with absolute purity. Registered Jersey calves, Southdown sheep, Chester White, Berkshire, Yorkshire, Essex pigs, all of the highest quality. Bred and for sale by F. A. C. McRIS Philadelphia, Pa. Please enclose stamp for full reply.

## "POLLED ANGUS

or Aberdeen Cattle." Frank R. Redfield, of Baravia, New York, is breeding and importing these famous cattle. Send for Catalogue.

## HARNESSES.

A GOOD, SUBSTANTIAL HARNESSES, Hand-made, full nickel-plated, for \$3.75. Call and see or send for sample. Also a complete assortment of RIDING SADDLES, BRIDLES, CARRIAGE ROBES, and DUSTERS, HORSE CLOTHING, and NETS. C. B. SMITH & CO., 40 Warren St., New York.

## ECONOMY WASHER CUTTER.

State which is wanted. Sent by mail prepaid to any address, on receipt of 50 cents. Liberal discount to agents. WILLARD BROS. & BARTLEY, Cleveland, Ohio.

## GAME FOWL BRED & SHIPPED.

Cattle, by J. C. COOPER, Cooper Hill, Limerick, Ireland.

## E. & O. WARD, PRODUCE COMMISSIONERS.

(ESTABLISHED 1845) Send for Circular of Great Value, giving full instructions for shipping POULTRY, GAME, BUTTER, and PRODUCE. No. 279 Washington St., N. Y. Tel., Irving National Bank, New York City.

## WM. CROZIER,

BEACON HILL, Northport, Long Island, N. Y. Importer and Breeder of Ayrshire, Guernsey, and Jersey Cattle, which always take the Highest Awards at County, State, National, and International Shows. Southdown Sheep direct from Lord Walsingham's flock, in England. Berkshires of the highest type. Collie Dogs of my own selection on the Highlands of Scotland. An inspection of the stock invited. Only 2 hours from N. Y. City.

FRIENDS! If you are in any way interested in

## BEES OR HONEY,

We will with pleasure send you a sample copy of our MONTHLY GLEANINGS IN BEE CULTURE, with a descriptive price-list of the latest improvements in Hives, Honey Extractors, Artificial Comb. Section Honey Boxes, all books and journals, and everything pertaining to bee culture. Nothing Patented. Simply send your address on a postal card, plainly, to A. I. ROOT, Medina, Ohio.

## Muth's All Metal Honey Extractor, And Uncapping Knife.

Have received the Highest Encomiums! Also Langstroth's Bee Hives; Honey Jars, and a full assortment of Bee-Keepers' Supplies. Every Bee-Keeper should send for my circular giving the details regarding the care of bees and how to get the most Honey. Sent free on application. CHAS. F. MUTH, No. 976 Central Ave., Cincinnati, O.

## BEES. Those wishing information concerning our HONEY. success in securing over 15,000 lbs. of honey from 176 colonies, the present poor season, should send for our full circular. L. C. ROOT & BRO., Medina, N. Y.

THE OOLOGIST.—A Magazine devoted to Birds and their eggs. Terms 60 cents for Current Vol. Sample copies 6 cents. THE OOLOGIST, Rockville, Conn.

## POULTRY WORLD.

A monthly magazine, the oldest, largest, and best periodical devoted entirely to poultry ever published. Splendidly illustrated. \$1.25 per year. Also the American Poultry Year, the only weekly paper devoted entirely to poultry in existence. \$1.50 per year. Both papers for \$2.00. A sample copy of both mailed on receipt of nine cents in postage stamps. Address H. H. STODDARD, Hartford, Ct.

## NOVELTY INCUBATOR.

I offer this as the simplest, cheapest, and best incubator in the market. Costing less than \$3.00 per day for oil. Hatches 80 to 90 per cent almost sure. Holds 100 Eggs. ## Popular Science Monthly.

Send postal card for full particulars to

D. APPLETON & CO., Publishers,

1, 3, & 5 BOND ST., NEW YORK.

## THE COST OF ADVERTISING

For any responsible advertiser, making application in good faith, we prepare and furnish a written estimate, showing the cost of any proposed advertising in the leading American newspapers.

We prepare and exhibit printed proofs of any proposed advertisement.

For preparing estimates no charge is made, and the applicant is placed under no obligation to transact his advertising business through us unless it appears to him that by doing so he will best advance his own interests.

A copy of the advertisement, a list of the papers, the space the advertisement is to occupy and the time it is to appear, should be given with the application for an estimate of the cost.

When an advertiser does not know what he wants, or what he ought to do, he can designate some sum of money within which he wishes to limit his expenditure; this will enable us to prepare for him such a list of papers as will be the best for his purpose, within the limits which he prescribes.

Send 10c. for 100-page pamphlet.

## GEO. P. ROWELL & CO.,

NEWSPAPER ADVERTISING BUREAU,

77 State Street Chicago, Ill.

## FORTUNES FOR FARMERS.

Fifty Thousand Farms!

6,000,000 Acres now offered by the Northern Pacific Railroad in Minnesota and Dakota

at \$2.50 per acre and upward, according to location and quality.

Best wheat land in the world! The richest meadow lands! The choicest timber lands! Suit best for diversified farming, stock raising, and dairying. Terms—One-sixth cash, balance in five annual payments at 7 per cent interest. Preferred stock of the Company taken at par in exchange for lands east of Missouri River. The best opportunity left in the United States to procure Government lands near railroad and towns is on the line of the Northern Pacific Railroad. Reduced rates of fare and freight to settlers. Reduced rate of fare to land seekers. For all information, illustrated paper, maps, &c., address

JAMES B. POWER, Land Commissioner,  
ST. PAUL, MINN.

Exhausted Wheat and Potato Lands may be Restored to their Former Fertility.

## The Mapes Complete Manures.

Prepared expressly for use on light and heavy soils for growing WHEAT, GRASS, POTATOES, TOBACCO, HOPS, SUGAR CANE, FRUITS, VEGETABLES, etc.

These highly concentrated Manures are now used by thousands of farmers in all the Seaboard and Middle States, as well as in South America and West Indies.

They are **not** stimulants, but **COMPLETE MANURES**, the same as Stable Manure, and their continued use result in **permanent improvement** of the land.

Growers in Ohio and other Middle States find them **more economical** even after paying railroad freights, than purchased stable manure or local fertilizers.

All Fertilizers, Peruvian Guano, Potash Salts, and Chemicals sold on **guaranteed chemical analyses**.  
Send postal for Pamphlet. Correspondence solicited.

**THE MAPES FORMULA AND PERUVIAN GUANO CO.,**  
**158 FRONT STREET, NEW YORK.**

P. VAN ZANDT LANE, President. CHARLES V. MAPES, Vice Pres't and Gen'l Manager. EDW. V. Z. LANE, Treasurer.

## SECOND TO NONE. Soluble Pacific Guano.

Sale in 1865 - - - 754 Tons.

" " 1879 - - 40,993 "

This Fertilizer, which was at first sold almost entirely in the Southern States, has of late years become so deservedly popular in the North, for the cultivation of all Farm Crops, that the Company have enlarged their works especially to supply the Northern demand, and we are now in a position to fill orders promptly. Pamphlets containing testimonials and other information furnished by our local agents, or on application to

## CLIDDEN & CURTIS,

GENERAL SELLING AGENTS OF PACIFIC GUANO COMPANY,  
BOSTON, MASS.

**THE EXTRAORDINARY SUCCESS**  
that this food has attained in this country (the sales of which aggregate as much as all other foods combined) is due to its intrinsic merit, containing as it does all the elements essential to *growth and repair* either in the Infant or Invalid. RIDGE'S Food is **NOT A MEDICINE**, neither is it a new, untried preparation, having been in use in England and the United States for 30 years—but it is a highly nutritious and because a cooked food easily assimilated. From a chemical standpoint approximates nearer to human milk than any other preparation.  
The success of RIDGE'S Food has caused the market to be overrun with worthless imitations. In asking for RIDGE'S Food see that you get it. **Take no other.** Can be had of almost any druggist. In cans of 35 cents, 65 cents, \$1.25, and \$1.75, bearing signature of  
WOOLRICH & CO., on every label.

## COLUMBIA BICYCLE.

Bicycle riding is unsurpassed as a method of travelling, whether for speed, sport, or the renewal of health. No horse can compare with the bicycle for endurance, no other pastime is half so fascinating, and the exercise is recommended by the medical profession as being most conducive to health. Appleyard rode 100 miles in 7 hours, over a common turnpike road, and Waller has accomplished 1,400 miles in 6 days. Send 3c. stamp for 24-page catalogue, containing price lists and full information, or 10c. for catalogue and copy of "The Bicycling World."

**THE POPE MFG CO.,**  
No. 101 Summer St.,  
Boston, Mass.

## NEW CHAMPION

SHOT GUN.

Retail Price.—Plain Barrels, 12 bore, \$14.00; Plain Barrels, 10 bore, \$15.00; Twist Barrels, 12 bore, \$17.00; Twist Barrels, 10 bore, \$18.00. The frame and trimmings of all these guns are Nickel Plated. This gun possesses many advantages over any single breech-loading gun yet produced in this country. It has a patent side-ang action with a safety attachment, by means of which it can be opened only when the gun is at half-cock, thus ensuring perfect safety in loading. The workmanship and materials used are first-class; no gun being allowed to leave the factory until it has been thoroughly inspected. We take great pleasure in offering this gun to the public, and feel safe to say it is the best American Single Breech-Loader yet produced. Send stamp for Illustrated Catalogue of Guns, Rifles, Revolvers, and Shotguns. Address JOHN P. LOVELL & SONS, Gun Dealers, Boston, Mass.

## Every Watch Owner's Friend.

A key that is always clean, and never wears out. Sold by all Jewellers and Watchmakers. Sent to any address, by mail, for 30c. Automatic Eye Glass Holders, by mail 25c. Birch's Pat. Key Ring, 10c. Send for circular.  
**J. S. BIRCH & CO., 38 Dey St., N. Y.**

# American Agriculturist.

## PREMIUM LIST.

SUPPLEMENT TO SEPTEMBER, 1880.

GROUSE OR PARTRIDGE SHOOTING.

COPYRIGHT, 1880, BY ORANGE JUDD COMPANY.

## The American Agriculturist.

The *American Agriculturist* was established in 1842, or thirty-eight years ago. The first number was issued under the editorial supervision of Mr. A. B. Allen. The original office was located in the basement of a building which stood on the present site of the *Times* edifice. Subsequently the paper had several publishers—including, among others, Saxton & Co., and likewise several assistant editors, including Solon Robinson. The office changed from one place to another until it was finally located at 189 Water street, nearly opposite to the United States Hotel.

In 1853, Mr. Allen called to the editorial chair Mr. Orange Judd, whose training he thought specially fitted him for the place. The latter had been reared on a farm, and, after graduating from college, had devoted some years to the study of the Science of Agriculture at Yale College with Silliman, Norton, Johnson, Weld, and others. In 1856 Mr. Judd purchased the paper, and subsequently associated others with him in the ownership and editorial management. The following rules of action were laid down for its conduct:

- 1st.—To make every line RELIABLE.
- 2d.—To get the BEST reading matter at any expense of time, labor, and money.
- 3d.—To engage upon the Editorial staff the best men to be found in the country, those of practical experience and wide information.
- 4th.—To always look after the wants and circumstances of those struggling with limited means.
- 5th.—To exclude from its business pages all advertisements of quackery, medicines, and unreliable advertisers.
- 6th.—To make the paper known to the whole country, and adapt its pages to all sections.
- 7th.—To make its teachings PLAIN and PRACTICAL as well as reliable.

From this time forward the circulation of the paper increased with great rapidity, and, compelled to seek more commodious apartments, it removed (1859) to spacious quarters extending through from Park Row to Nassau Street. New subscribers continued to pour in from all quarters, and it was not long before the *American Agriculturist* subscription hooks embraced names from nearly every Post-Office in the United States. Since that period the regular circulation of the *American Agriculturist* has often been above 100,000, sometimes running up to nearly 150,000. In 1867 the paper moved to its present site—the six-story building at 245 Broadway—which was purchased and specially fitted up at large expense to meet the growing wants and requirements of the establishment. During the past twenty years the *American Agriculturist* has absorbed, by purchase and otherwise, some twenty other journals of a similar character throughout the United States. This unexampled prosperity has been due to rigid adherence to the rules referred to above. It has always been the aim of the paper to secure the very ablest talent in the country, and, though issued only twelve times a year, the annual editorial expenses have been larger than those of many metropolitan dailies.

Eighteen years ago, Dr. George Thurher, who is one of the highest authorities in botany and horticulture and has no superior in general departments of knowledge, became associated with Mr. Judd in the editorial supervision of the paper, and they continue in that relation at the present time.

The illustrations have been a leading feature of the *American Agriculturist*, and no expense has been spared to secure the very best. Many hundred thousands of dollars have been expended in this manner for the benefit of the readers.

Another feature which has specially commended itself to the public, and which is still prominently maintained, is the exposure of Humbugs and fraudulent schemes of all descriptions. Thousands of grateful letters from those who would otherwise have suffered, bear witness to the value and importance of these exposures. For other leading features, we refer the reading public to the paper itself.

Continuing under the same auspices, with strong young men training to the work, it may be safely

predicted that, as grand and successful as has been its career in the past, and as high as its standard is to-day in circulation and influence, not only throughout our own country, but in other lands, the *American Agriculturist* is only entering the gateway of a still wider field of circulation, and of useful work and influence.

## The Amerikanischer Agriculturist.

The *Amerikanischer Agriculturist* was established in 1853, twenty-two years ago. It has had all the advantage of the machinery and expense employed in the preparation of the *American Agriculturist*, and the writers are thoroughly familiar with the wants and requirements of German farmers, gardeners, fruit growers, etc., in the United States. Professor Charles Munch, of Missonri, whose name is well known wherever the German tongue is spoken, has for years had control of departments in the paper especially adapted to his countrymen, and it has given such satisfaction that the German *Agriculturist* is now largely read in the Fatherland. One class there take the paper because of the practical hints and suggestions. Another class, who contemplate emigrating to the United States, subscribe in advance to the *Amerikanischer Agriculturist*, in order to acquire knowledge and information regarding the climate, soil, and agricultural features generally of the new country to which they are going. It likewise has subscribers in Russia, Norway, Sweden, and through all Europe. Those in this country having relatives and friends in the old world, who are preparing to emigrate hither and settle on farms, cannot do them a greater service than in sending them the *Amerikanischer Agriculturist*, for preparation prior to their departure. Like the *American Agriculturist*, the *Amerikanischer Agriculturist* has successfully gone forward, while other similar papers have succumbed, until it is now, with one exception, the only purely German agricultural journal published in the United States. It is furnished at the same low rate as the *American Agriculturist*, viz., \$1.50 per year, postage prepaid.

## Why they Do Not Stay on the Farm.

There is no denying it; the boys do not stay upon the farm, and will not unless some constraint is put upon them. Why is it? There are many causes operating to this end; the new land in the west, the adventure of mining life in the mountains, the new fields open in the cotton belt, speculation and business in the neighboring village or city—but above all these is the social leanness and starvation of American agricultural life. We are speaking now of the isolated farming districts, from five to ten miles from the market town. Here is the old style school house, and the means of education are just as they were fifty years ago or more; the winter school of four months, taught by master, and summer school of three, taught by mistress, both hired at cheapest rates, and some are still "hoarding round." The old church is yet there for Sunday gatherings, and church and school are about the only occasions of social life known to old and young, except in rare visits to other communities. The main thing is work, early and late, summer and winter; and the chief problem for the brain to solve is how to get a living. The whole population is not so much engaged in living, and in enjoying life, as in getting ready to live. If we look in-doors there is rather a lean larder the year round. Salt junk and potatoes are the main stay. The body is not well provided for. The search for a soft bed is not well rewarded. The intellectual life is more poorly fed. Often no paper at all is taken. If one is afforded, it is likely to be a political journal. Agricultural papers are the rare exception. There is little but gossip for the mind to feed upon. The school is often neglected because the boys and girls are wanted at home. The church is neglected because it is not convenient to go to meeting. The horse sheds are not built, the horse is lame, the carriage has a broken spring, or, more likely, the preacher gives out too much light for the surrounding darkness. Bats love twilight. The muscles are overtaxed, and vitality is mainly occupied in sus-

taining the waste of muscle. There is no time for recalling the daily news, for discussing agricultural topics even, or for the enjoyment of social life at the table. Father and mother live under pressure all the while. Hearty sympathetic interest in anything outside of the farm, is almost unknown. Smiles are few, and jokes still fewer. Young America on the farm revolts against this eternal round of solemn facts. He wants a little variety in his diet for his body, and for the mind. He has seen agricultural papers with pictures of fine horses and cattle, houses, and barns, labor-saving machines, and tools. He would like to read about these things, and realize the pictures. He wants more papers and books, lyceums, lectures, and especially more society. He wants to enjoy life a little while he is young, and not to wait for gray hairs before he begins to live.—Here is the cause of our waning agriculture and deserted farms. The remedy is more easily seen than applied. We must have more living while we are getting ready to live.

## Business Habits for Farmers.

There is probably not one farmer in ten thousand who keeps a set of accounts from which he can at any moment learn the cost of anything he may have produced, or even the cost of his real property. A very few farmers who have been brought up to business habits keep such accounts, and are able to tell how their affairs progress, what each crop, each kind of stock, or each animal has cost, and what each produces. Knowing these points a farmer can, to a very great extent, properly decide what crops he will grow, and what kind of stock he will keep. He will thus be able to apply his labor and money where it will do the most good. He can weed out his stock and retain only such animals as may be kept with profit. For the want of such knowledge, farmers continue, year after year, to feed cows that are unprofitable, and frequently sell for less than her value one that is the best of the herd, because she is not known to be any better than the rest. Feed is also wasted upon ill-hred stock, the keep of which costs three or four times that of well-hred animals, which, as has been proved by figures that cannot be mistaken, pay a large profit on their keeping. For want of knowing what they cost, poor crops are raised year by year at an actual loss, provided the farmer's labor, at the rates current for common labor, were charged against them. To learn that he has been working for 50 cents a day, during a number of years, while he has been paying his help twice as much, would open the eyes of many a farmer who has actually been doing this, and it would convince him that there is some value in figures and book accounts.

## Farm Villages.

There is no necessity that farmers should be isolated so much as they generally are, nor any need that the farm buildings should be in the center of each farm. It is simply a matter of figures and calculation, as to whether the saving of a few hours' labor—or a few days in the aggregate—yearly, in hauling the crops to the barn, with the barn and house in the center of the farm, and a mile away from the nearest neighbor, is of more value; or more convenient than to have one's neighbors closer and one's fields farther off. There are many advantages in having three or four homesteads contiguous and forming a hamlet, or with a few tenant houses or cottages, a small village. This is especially desirable in the West, where the land was originally so divided that four farms necessarily meet at one corner, where two roads cross. Where farms are 160 acres in extent, there would then be four houses together at every mile; four sets of farm buildings; four orchards, and four plantations, which would condense the shelter provided by these, and make it much more effective than when scattered half-a-mile apart. There would be far better social opportunities than farmers now enjoy, and many more opportunities for combining labor and capital in joint enterprises.

# H.W. JOHNS' ASBESTOS LIQUID PAINTS

Are the purest, finest, richest, most durable and economical paints ever made for structural purposes. See editorial article in April No., 1879, of *Am. Agriculturist*. Samples of colors and Descriptive Price Lists free by mail:

WORCESTER, MASS., January 9th, 1880.  
H. W. JOHNS MFG. CO., 87 Maiden Lane, New York:  
DEAR SIR:—We consider H. W. Johns Mfg. Co.'s goods strictly first-class, and not equalled by any others in the market. As compared with other Liquid Paints, it is sufficient for us to state that we have displaced them all in favor of the former. Truly Yours,

JEROME MARBLE & CO.  
ADAMS, MASS., May 9th, 1879.  
H. W. JOHNS MFG. CO., 87 Maiden Lane, New York:  
DEAR SIR:—We have sold and used H. W. Johns' Liquid Paints for three years, and they have given perfect satisfaction to all who have used them. Among others, L. L. Brown Paper Co., Renfrew Mfg. Co., Arnold Print Works, Freeman Mfg. Co. We think they are the best Paints in use. Yours truly,

F. E. MOLE & CO.  
LAKE VIEW HOUSE, LIVONIA, N. Y., Feb. 9th, 1880.  
H. W. JOHNS MFG. CO., 87 Maiden Lane, New York:  
DEAR SIR:—We have used your Paint on our buildings and find one coat goes as far, and covers as well, as two coats of Lead and Oil. Yours truly,

E. R. BOLLES.  
OFFICE OF AMERICAN AGRICULTURIST,  
NEW YORK, July 22d, 1878.  
H. W. JOHNS MFG. CO., 87 Maiden Lane, New York:  
DEAR SIR:—I have used your Paint upon outside work of my house, and can already see that the work done with it is superior to that done with the Lead and Oil Paint. I am much pleased with the Paint, and wish now to try the pure white for inside work, etc. Yours truly,

HENRY STEWART.  
ATBURN, March 1st, 1878.  
H. W. JOHNS MFG. CO., 87 Maiden Lane, New York:  
DEAR SIR:—In answer to your inquiry as to how we like your Paint, we are more than entirely satisfied with it. As you are aware, we are large users of paint, and of all that we have ever used, are satisfied yours is far superior; it is put on with less labor, covers better, flows more easily, has a better body, and, as far as our experience goes, will stand the weather better than any other paint we know of. Your roof paint is unsurpassed; we used one coat on a tin roof, and to-day it looks as fresh, and the color is as bright, as when first applied. Respectfully yours,

JOSIAH BARBER & SONS,  
Manufacturers of Woolen Goods and Carpetings.

H. W. JOHNS' MFG. CO., 87 Maiden Lane, N. Y.

"We do not believe the improvement has ever been equalled."—*Arthur's Home Magazine*, Phila.

## A few of the Best Autographs, showing Improvement from Using GASKELL'S COMPENDIUM

(Self-Teaching Penmanship), received Recently.

Former Style:

*M. M. Thomas*

Present Style:

*M. M. Thomas*

Post-office address: Thorndike, Massachusetts.

The best specimens of improvement this month come from MR. W. WIRTHWINE, 205 Wade St., Cincinnati, Ohio, now bookkeeper for W. W. Bostwick & Co., of that city, his rapid and neat penmanship securing him the position. We give his portrait and autographs (both old and new) below:

[From the *Inter-Ocean*, Chicago.]

"GASKELL'S COMPENDIUM has become the most popular self-teaching penmanship ever published. It has sold to the extent of nearly one hundred thousand, going to all parts of the English-speaking and writing world, and furnishing young people with the material for self-instruction at their own homes, in a complete, compact, and elegant form. Thousands of the best young men in this country, it is claimed, have learned from it; and this claim is substantiated by the hundreds of specimens of improvement in handwriting, copied by the photographic process, now being published in the magazines and other periodicals."

[*Demorest's Monthly*, N. Y.]

"There is no more sure test of refinement than an elegant handwriting, and there is no accomplishment more rare, because unless acquired in youth, it is difficult to attain it in later years. A most useful aid to the acquisition of a clear, beautiful style of penmanship is GASKELL'S COMPENDIUM. We heartily recommend it as invaluable in the formation of a handsome style of handwriting."

Post-office address: Brandon, Vermont.

GASKELL'S COMPENDIUM consists of a full series of COPY-SLIPS, BOOK OF INSTRUCTIONS, ORNAMENTAL FLOURISHING, LETTERING, PEN-DRAWING, LADIES' PENMANSHIP, &c., &c. By means of this self-teaching system any one can acquire a rapid and beautiful handwriting at odd hours without a teacher. It is the finest Penmanship ever published, and put up in durable and elegant form. PRICE ONE DOLLAR, for which it will be mailed, prepaid, anywhere. Address

Prof. G. A. GASKELL, Principal Business College, Jersey City, N. J.

Also, Proprietor Bryant & Stratton College, Manchester, N. H.

The Penman's Gazette, handsomely illustrated, giving many other specimens of improvement, ornamental penmanship, &c., &c., and full particulars of this system, free to all who write for it.

## XX COT (not painted, White Duck) \$2.

Makes a perfect bed. No mattress or pillows required. Better than a hammock, as it fits the body as pleasantly, and lies straight. Folded or opened instantly. Self-fastening. It is just the thing for hotels, offices, cottages, camp-meetings, sportsmen, etc. Good for the lawn, piazza, or "coolest place in the house." Splendid for invalids or children. Sent on receipt of price, or C. O. D. For 50 cts. extra, with order, I will prepay expressage to any railroad station east of Mississippi River and north of Mason and Dixon's Line. For 75 cents, in Minnesota, Missouri and Iowa.  
HERMON W. LADD, 108 Fulton St., Boston; 207 Canal St., New York; 155 North Second St., Philadelphia; 94 Market St., Chicago. Send for Circulars.

TO KEEP IT SWEET **CIDER** or prevent Secondary FERMENTATION.

USE IMPROVED PRESERVING POWDER

It does not impair the taste or flavor, is thoroughly reliable and absolutely harmless to the human system. Send 85 cts. for a sample, forwarded free, sufficient for 40 gallons. Per pound \$1.50, sufficient for 300 gallons, receiver paying charges. Price lower in larger quantities.  
W. ZINSSER & CO., 197 William St., New York.

**BIG** BEST Bargains offered in Dry Goods, Fancy Goods, Clothing, Musical Instruments, Watches, Clocks, Revolvers, Rifles, Shot Guns; in fact, Anything and Everything you may want at the Lowest Prices known. Valuable Presents given to any one making up clubs. Our large illustrated Catalogue of over 10,000 articles sent free. Address BELCHER, JAMES & CO., Box 670, Boston, Mass.

We invite the careful attention of all our friends and the "rest of mankind" to the remarkably fine list of Articles and Books described in the following 26 pages. The variety is very large, containing something suitable to every circumstance, every occupation—for old and young—things valuable for one's own use, for Presents to Friends, for Holiday Presents, Wedding Gifts, etc.

## Easily Obtained.

There is not a town or neighborhood in all the country where one or more persons of a little enterprise, may not secure one, two, or more of these excellent Premium Articles *without money outlay*, and at the same time *confer a real benefit upon every person they shall influence to become a subscriber and reader*. It only needs the will—the determination—to accomplish it easily.

Those not having time or inclination to get them as premiums, will find some smaller articles offered at the close of next page in connection with subscriptions.

Others will find it convenient to secure them by PURCHASE at the prices named with each, as they are selected with special care, and many of them can be sent anywhere by mail.

## Of Guaranteed Quality.

Every Article offered on the following pages is of the best Quality, *guaranteed to be just as described*. Every thing is New from the Manufacturers—no second-hand, or shop-worn, or unsalable article is offered. These facts will make it all the more desirable to secure them, as there will be no risk or fear of deception or of defect in the quality or character.

## New Premiums This Year.

The Premium List may look familiar to old subscribers, because it contains all the old premiums we could arrange for, which were largely called for and approved last year and are therefore likely to be wanted by others. But many NEW and desirable articles are scattered all through the following pages, wherever the printer has found it most convenient to arrange them in making up the columns.

**Carefully Preserve This Premium Sheet** for future reference. The Offers go into effect Sept. 1, 1880, and extend to June 30, 1881.

## Who Can Get Premiums.

**PLEASE TAKE NOTICE** that no premium is offered to any one as an inducement to become a subscriber. If the *American Agriculturist* is not good enough and cheap enough—does not contain useful information enough in its reading pages, its many hundreds of engravings, its trustworthy business pages—to be worth its small subscription price, **DON'T TAKE IT.**

Those Subscribers who are in no premium list, are, as members of the family, so to speak, given an opportunity to get some Premium articles at lower rates than "outsiders," as noted on p. 378.

The Premiums are offered as remuneration for time, or effort, used in making the *American Agriculturist* known to others, inviting them to subscribe, in receiving and forwarding new single subscriptions, or collecting clubs of subscribers, old or new. It is supposed that any one doing this is himself a subscriber, except in the case of dealers. **BUT** any one may include his own name in a club of *two or more* names for a Premium.—(It is hardly "on the square" for one to drop his own subscription, and send in the name of another member of his family, or other person, as a new name.)

## Politics Will Rage

during two or three months. Any enterprising man, without lessening his public (or political) duties, may keep quietly picking up names of subscribers, and thus get from our premium list something valuable to show (or use, or sell) after the "smoke of battle" in politics clears away. **Begin to-day.** (See "Extra Long Year," p. 378.)

## To Strangers.

The *American Agriculturist* (so called because started in 1842, as a Rural Journal) has been greatly enlarged, and widened in scope, without change of name, until it now meets the wants of ALL classes, in City, Village, and Country; it is literally **EVERYBODY'S PAPER**. It helps the **FARMER**, the **GARDENER**, the **FRUIT GROWER**, the **MECHANIC**, the **PROFESSIONAL** and **BUSINESS** man; it greatly aids every **HOUSE-KEEPER**; it pleases and instructs the **YOUTH** and the **LITTLE ONES**.

It is edited with **great care**, labor, and expense, to have every line **reliable**, while its pages abound in a great variety of **useful, practical, reliable** information and suggestions.

Every number contains **40** or more large pages, well printed on fine paper, besides a Tinted Cover newly Illustrated on each number.

Every number contains from **60 to 100 NEW Engravings**, describing a great variety of Labor-saving, Labor-helping devices and Household Economies, Animals, Plants, Flowers, with many Pleasing Pictures, etc. In this respect it *surpasses, by far, all other like journals, and is wanted by every one, in Country, Village, and City, no matter how many other journals one may have.*

Its constant **Exposures of Humbugs** and Swindling Schemes are invaluable everywhere, and save many times its cost to almost every reader. It admits no medical advertisements, and no untrustworthy advertisers. Its immense circulation enables the Publishers to issue it at very low rates, and to deal liberally with subscribers in the way of premiums, etc. Taking into account its size, its reliability, its beauty, its **REAL VALUE**, it is the **CHEAPEST JOURNAL IN THE WORLD!**

## Premium-Giving Explained.

Some who have not looked into it, imagine that premiums are given to make the paper itself more attractive; or that expense for premiums lessens the value of the paper itself. *Nothing of the kind, but quite otherwise*, as witness:

Most active business enterprises, publishing included, employ agents or retail dealers at different points to carry on and extend the business, and pay them by commissions or reductions in prices. The Publishers of the *American Agriculturist* merely follow the general custom in their own way. It is very *convenient to the subscribers themselves*, as well as to the publishers, to have one or more persons in each locality who will receive and forward subscriptions and solicit new names.

But this Journal circulates so extensively, and the profits on individual subscriptions are so small, that a system of agencies is impracticable; the Publishers therefore invite *everybody* so disposed to act as voluntary agents in gathering and forwarding the subscriptions of both old and new readers. As a return for such friendly aid, they now, as for over 20 years past, offer a list of *good Premium Articles, Books, etc.*, simply as rewards or remuneration to those who voluntarily give any time or attention to promoting the interests or circulation of the *American Agriculturist*. These Premium Articles are *just as good as money*, for use, or for sale even, while, by special facilities, by large cash and wholesale purchases, by advertising arrangements, etc., the Publishers are able to offer in these articles *much higher rewards* than they could in money.

The money paid for these premiums comes from advertising receipts, which are increased by the larger circulation obtained through premium-giving. Much extra advertising comes through the extra premium sheet itself; in fact, the paper is better and cheaper because of the premium enterprise.

**Some Good Advertisements** will be found on pages 375 and 376, also on pages 405 to 412, and on three cover pages, which will be worth looking through for information. This Journal excludes all medical and all unreliable advertisements and advertisers. We aim to admit only those who have both the *ability* and *intention* to do just as they promise. When writing to our Advertisers, please inform them where you saw their announcements.

It is Important to

## READ All the following Premium Regulations:

**1st.** Send subscriptions as fast as gathered (with the exact money), that the Subscribers may begin to receive the Journal at once, and take your own time to complete your list and select your premiums. You can have all the time desired up to July, 1881. In sending names for a premium club, state the fact, and they will be entered to your credit in a special Premium Record. You can close your list and call for your premiums at any time previous to July 1, 1881....**2d.** Old and new subscribers all count in Premium Clubs of two or more names, but a portion at least should be new names; it is partly to get these that we offer premiums to canvassers....**3d.** Premium clubs may be from any number of different Post-Offices, if all are gathered and sent by the same person. Clubs may consist of *English* or *German* subscriptions, or both....**4th.** A Specimen Number will be supplied free, when needed for canvassing, but extra numbers are expensive, and should be used carefully and economically, and where they will tell. Other specimen numbers will be sent, post-paid, to canvassers only, on receipt of six cents for each copy desired. The regular price is 15 cents per number.

### Get Premium Names Anywhere.

—As above noted (3), names for Premium Clubs can be gathered from any number of post-offices, and the papers will be mailed to each subscriber's address—but the names for any Premium Club must all be sent in by the person who collects them.

**Subscriptions Count ONLY in One Premium List.**—Of course no subscription can count more than once for any premiums; or be counted for any premium, when articles or Books are taken with subscriptions, at lower prices, as offered in 3d column of this page.

**Delivering the Premiums.**—All mailable premium articles will be delivered free at the Office, 245 Broadway, or be forwarded by mail, post-paid, to any part of the United States and Territories when no postage is specified, or on receipt of the postage when any amount is stated. Unmailable articles will be forwarded by freight, express, or otherwise, as desired by each recipient, the carriage to be paid by the recipient. The exclusion of some articles from foreign mails, and the varying duties or Custom charges upon others, preclude any general rule for foreign lands. **To British America**, (except Newfoundland,) the postage to be prepaid on Mailable Premiums is 10 cents on each parcel, and nothing over 8 ounces can be mailed. Newfoundland postage is the same as to Postal Union foreign lands. We will make all possible efforts to accommodate our foreign readers.

**Foreign Subscription Rates.**—The Subscription Rates of the *American Agriculturist* (English or German editions) are the same everywhere, EXCEPT that 18 cents per year additional for the extra postage is required when this Journal is mailed outside of the United States or the Canadas. With this exception, and the matter of delivery noted above, the Premium offers are universal to all countries embraced in the Postal Union.

**Low Express Charges.**—On such articles as are to be forwarded by express or freight, the charges will usually be moderate. The cost in any particular case can be best learned at the express or freight office nearest one's own residence.

**"Registering" Premium Articles Mailed.**—Mailable articles, of 2d and 3d class, can now be "Registered" for 10 cents extra per parcel, up to four pounds. Any one entitled to a premium article to be sent by mail can have it registered by sending us this extra 10 cents.

Subscriptions for English or German Editions are at the same rates, and count alike for Premiums, together or separately.

**GERMAN Subscriptions Count in Premium Lists.**—The subscription rates of the German (*Amerikanischer Agriculturist*) are precisely the same as for the English Edition, and any Premium List may consist wholly of English or of German subscriptions, or of any part of each.

**The Prices of Premiums**, as given, are the lowest regular standard rates established by the manufacturers and dealers. These prices are frequently lower than similar articles of the same good quality are sold for in many places.

**How to Send Money.**—Send money by Postal Money Order, or by Checks or Drafts on New York Banks or Bankers, payable to order of Orange Judd Company. If neither of these is obtainable, send the money by Register Letter, affixing stamps both for the postage and registry.

## Large Pay for Little Work.

One subscriber obtained each day (or evening, without loss of time), is 25 a month, and that will bring the reward of good articles from the premium list, worth \$25.00 either for use or sale, or \$25.00 in good Books, or several smaller articles, worth together \$25.00, when subscriptions are sent at full rates (\$1.50 a year). There are few places where there are not at least 25 persons who would be much benefited by reading the *American Agriculturist*, and who would take it if shown its real value. In many single towns there are from fifty to twelve hundred subscribers, and premium clubs need not be confined to one town or post-office.

**A CAPITAL BUSINESS.**—While every subscriber can collect, in his own vicinity, two, five, ten, twenty, up to one hundred or more premium names, as many have done, many others can pursue canvassing as a good and profitable business, receive the premium articles, and sell them for cash, as they are all good, popular, and readily salable. This has been done with great profit in years past. Some make poor work at first, but by perseverance and learning how to do it, they become expert and highly successful. The most successful canvasser in this way is a Lady who has thus secured an income larger than is obtained by most farmers or professional men. We employ no "Agents," and issue no certificates, but any one can canvass where he is known, and if desiring to go into neighboring towns can, if himself trustworthy, get any needed endorsements from persons well known in his own section of country.

## Extra Long Year,

**Beginning To-day!**—To help all our friends to immediate success in securing valuable Premium articles, we make the following offer:

Every new subscriber for 1881 received after Sept. 1st, 1880, will be entered at once upon our mail books, and receive, without charge, the numbers issued in 1880 after his name arrives.

(Subscribers received in September, 1880, get the paper 15 months for a year's payment; in October, 14 months; in November, 13 months.)

This offer is to ALL NEW subscribers for 1881, in premium clubs or otherwise. So the forming of premium clubs can Begin at Once.—The extra copies offered will be a special incentive to new subscribers. Old subscribers need no inducement, and they will renew now for next year, as well as later, and thus help swell the premium club.

## BEGIN AT ONCE.

While the Premiums are for volume 40 (all of 1881), the collecting of names can be best begun at once. For strong Reasons see item "Extra Long Year." Fairs, Political Gatherings, evening visits, correspondence with friends, etc., can all be used advantageously in collecting names.

**Articles Wanted at a Definite Time**, for Premiums or otherwise, should be secured long enough in advance to allow for accidental delays in transportation, etc. REMEMBER: that, as the Holidays approach, there will be an immense pressure upon manufacturers and dealers; also upon Express and Railway Companies. Also: that when any articles happen to be in large popular demand, the stock manufactured may sometimes be temporarily exhausted. When we know in advance just what is wanted, we can have it ready. Usually they will be sent promptly when called for.

**A GENERAL PREMIUM (For Subscribers at Club Rates).**—In the Descriptions, each premium is offered for a stated number of subscribers at the regular single subscription price of \$1.50 each. BUT, First: Any one sending in from ten to fifty subscriptions at the lowest large Club rate, may select any Premium Articles or Books desired, to the amount of 12 cents for each name sent at \$1 a year. (No names will be received at this rate unless at least ten are sent by the same person.)—Second: Any one sending above 50 such names (at \$1.00 each) may select premium articles or books to the amount of 15 cents for each name. (No combination of lists or transferring of names to other lists will be allowed under these two offers.)

## PREMIUMS and BOOKS

FOR

ALL Subscribers (Old or New,)

## AT REDUCED PRICES.

To accommodate our friends sending in their own renewals or new subscribers for 1881, when such subscriptions are on no premium list, we make the offers below, which will give to every one desiring it some advantage from the premium list.

(The mode of delivery and postage, when any postage is required, is stated with each premium. For Book Postage, see Delivery of Books, page 380.)

**N. B.—Special.**—All NEW subscribers for 1881 under the following offers, received in Sept., Oct., or Nov., 1880, will have all numbers for 1880 issued after they come to hand, without extra charge.

### \$1.75 will pay for

The *American Agriculturist* to the end of 1881, and also any Premium Article or BOOK described, whose price does not exceed.....50 cents.

### \$2.00 will pay for

The *American Agriculturist* to the end of 1881, and also any Premium Articles or BOOKS described, whose price does not exceed.....90 cents.

### \$2.25 will pay for

The *American Agriculturist* to the end of 1881, and also any Premium Articles or BOOKS described, whose price does not exceed.....\$1.30

The *American Agriculturist* to the end of 1881, and also any Premium Articles or BOOKS described, whose price does not exceed.....\$2.10

### \$3.00 will pay for

The *American Agriculturist* to the end of 1881, and also any Premium Articles or BOOKS described, whose price does not exceed.....\$2.50

# THE PREMIUMS.

## GOLD and SILVER.

**Nos. 1 to 13.—Genuine Gold and Silver.**—BEAUTIFUL PRESENTS.—The old establishment of BENEDICT BROTHERS, 171 Broadway, N. Y., has long been most favorably known as trustworthy dealers, not only in Watches ("Benedict's Time" has become a household word throughout the country), but also in a large variety of Diamonds and genuine Gold and Silver articles (they deal in no others), from the smallest Gold Ring to the most costly Jewelry of all descriptions. To meet the wishes of our subscribers desiring genuine solid Gold and Silver articles, of *guaranteed quality*, for use, or for holiday, or wedding, or other presents, we select those named below. They are furnished to us by Messrs. Benedict Brothers, an ample guarantee as to their quality. The prices named are the lowest at which they can be supplied by any dealer. The Gold articles 14 carat fine and upwards (no Jewelry, to wear well, is over 14 carats.) They are late beautiful patterns:

**No. 1.—Gold Locket**, exactly the size of engraving—solid 14-carat gold, richly engraved and very finely enameled. Arranged for two pictures, under glass. Suitable for Lady or Gentleman. Price \$10.25. We will present it for *Thirteen* subscribers at \$1.50 each, and send it paid by Registered Mail.

No. 1.—Locket.

No. 2.—Cross.

**No. 2.—Roman Gold Cross.**—Solid 14-carat gold. Beautifully beveled edges. Ornamented with Etruscan work. Exact size shown by engraving. Price \$8.75. This will be presented for *Eleven* subscribers at \$1.50 each, and sent in Registered Mail post-paid.

**No. 3.—Watch Charm.**—Of 14-carat solid gold. This is a beautiful shrill-toned Whistle. Price, \$3.00. This will be presented post-paid for 4 subscriptions at \$1.50 each.

No. 3.

**No. 4.—Compass Charm.**—A very useful as well as ornamental Watch Charm. 14-carat gold case, with strong glass front, with accurate and sensitive needle. Price, \$5.75. We present it for *Seven* subscriptions at \$1.50 each. [Mailed free and Registered].

No. 4. Watch Charm.

No. 5.—Shawl or Lace Pin.

**No. 5.—Shawl or Lace Pin.**—This is solid Roman gold, 14-carat, richly ornamented with bright raised work; very fashionable now. Price \$7.25. Presented for *Nine* subscribers at \$1.50 each (Registered).

**No. 6.—Sash Pin.**—(Is also called Bih or Baby Pin.) Same quality and workmanship as the Lace Pin above; solid 14-carat gold. The price is \$3.00. Presented and sent in Registered Mail for *Four* subscriptions at \$1.50 each.

No. 6.—Sash Pin.

**No. 7.—Ladies' Gold Set — Brooch and Ear-Rings.**—The engraving faintly shows the beauty of the pattern, but gives the exact size. They are of solid 14-carat gold, of the best workmanship, finely enameled and ornamented with pearls. The Brooch has the improved catch or hook at the back for attaching a watch-chain when desired. This is the most acceptable set we have seen for the cost of \$17.00. We will send this Set for a club of *Eighteen* subscribers at \$1.50 each. (If desired we will present the Brooch separately for eleven subscriptions at \$1.50 each [or supply it for \$9.00]—or the Ear-rings for ten subscriptions [or for \$8.00].—Note that these are not the common 5 to 10-carat gold, often sold, but of the best 14-carat quality, made by first class Jewelers. This applies to all gold articles, Nos. 1-13.

**No. 8.—Seal Ring.**—Solid 14-carat gold, richly engraved Shank, with fine Bloodstone, or with any col-

No. 8.—Seal Ring.

No. 9.—Band Ring.

or of *Onyx* the recipient may prefer. Send exact size of finger by an old cheap ring, or bent wire, or a hole cut in a card. Price \$3.50. We will present this choice Ring for *Eleven* subscriptions at \$1.50 each, and send it free in Registered Mail.—A very Beautiful Present.

**No. 9.—Band Ring.**—Solid 14-carat gold, richly engraved, as partly indicated in the cut. (Send size wanted, as above.) Price \$4. Presented for *Six* subscribers at \$1.50 each. [Sent Registered by mail.]

**No. 10.—Napkin Ring**, of solid *Sterling* Silver, (eight per cent purer than coin), are heavy and richly engraved. Size and pattern shown in cut. A beautiful present. Price \$3.00. Sent post-paid, for *Four* subscriptions at \$1.50 each [or for \$3.00.]

No. 10.—Napkin Ring—Made of Solid Sterling Silver.

**No. 11.—One Set (3) Gold Studs.**—14-carat, solid; either spiral or hutton hacks indicated in engraving, as desired. A choice given of either polished or Roman gold. Price of *three*, in either style, \$5. We present the set (3) for 7 subscriptions at \$1.50 each [or for \$5]. Sent Registered and post-paid.

**No. 12.—Pair Gold Cuff Buttons.**—Solid 14-carat. The size is shown in the engraving. Your choice of either plain Roman or polished gold. Price \$8. We will present a pair of these for *Ten* subscriptions at \$1.50 each, sending them Registered and prepaid to any point.

No. 12.—Cuff Buttons—[1/2-inch].

**No. 13.—Collar Button.**—Solid 14-carat gold. You can have your choice of either Roman or polished gold. Price, \$2.50. Presented for *Four* subscriptions, at \$1.50 each. [Mailed post-paid.]

**No. 14.—Coral Jewelry.**—We have made arrangements with the well known house of Messrs. HALL, NICOLL & GRANBERY, Nos. 20 and 22 John Street, New York, for the supply of sets of this very beautiful jewelry. Owing to the fact that Coral Jewelry is hand-made, there are no two sets alike, and it would be impracticable to give illustrations of many of them. The above is an engraving of a selected specimen, which is composed of leaves and flowers, of fine color and carving; while others are made of fine-cut coral beads. The selection of necessity have to be left with us, after the price of the Premium had been determined, unless the person securing it were here to select for himself. We can supply the sets as Premiums as follows: Coral Set, consisting of Brooch and Ear Rings. Price, \$2.50. *Four* subscriptions at \$1.50 each, will secure this. # RURAL BOOKS.\*

Here is an opportunity, not only for individuals to obtain good books for themselves and families, free, but also for the **Farmers of a neighborhood to unite their efforts in raising a club of subscribers, and through these premiums get an Agricultural Library for the general use of all.** Let some enterprising, public-spirited farmer in every neighborhood start this matter, ask his neighbors to help make up a list, and thousands of such Libraries will be established all over the country, which, with the copies of the *Agriculturist* thus scattered, will have a wonderful influence in developing thought, increasing intelligence and awakening inquiry, and the increased profit resulting will be beyond estimate. Remember that by gathering a club of ten or more subscribers at \$1.50 each, you get for yourself or your club, \$10.00 worth of Good Books, and One Dollar's worth more for every such subscription over ten. An unprecedented opportunity to get a Library of \$10, \$20, \$50, or even \$100 worth, or more, of Good Books.

## Farm and Garden.

**Farm Implements and Farm Machinery.**—By John J. Thomas. A new, revised, and enlarged edition. Fully illustrated. Handsomely bound. Tinted paper. \$1.50.

**New American Farm Book.**—By R. L. and L. F. Allen. Revised and enlarged Edition. This work comprises all that can be well condensed into an available volume of its kind. Substantially bound, and printed on tinted paper. \$2.50.

**Talks on Manures.**—By Joseph Harris, author of "Harris on the Pig," "Walks and Talks on the Farm," "Talks on Farm Crops," etc. An entirely new volume, full of practical and valuable information. \$1.50.

**How Crops Grow.**—By Prof. Samuel W. Johnson of Yale College. A Treatise on the Chemical Composition, Structure, and Life of the Plant. The book is invaluable to all farmers. Bound in cloth. \$2.00.

**How Crops Feed.**—By the same author. A Treatise on the Atmosphere and the Soil, as related to the Nutrition of Agricultural Plants. This is an excellent companion book to "How Crops Grow." Bound in cloth. \$2.00.

**Gardening for Pleasure.**—By Peter Henderson. A Guide to Amateurs in the Fruit, Vegetable, and Flower Garden. Full Directions for the Greenhouse, Conservatory, and Window Garden. \$1.50.

**Gardening for Profit.**—By Peter Henderson. The recognized standard work on Market and Family Gardening. Fully illustrated. Neatly bound and printed on fine paper. \$1.50.

**Farm Gardening and Seed Growing.**—By Francis Brill. Has full directions for growing and saving seed for the market. Bound in cloth and printed on tinted paper. \$1.00.

**Waring's Elements of Agriculture.**—By Geo. E. Waring, Jr. A Book for Young Farmers. Hardly any one is so wise that he will not learn something of value from the perusal of this work; no one is so ignorant or undeveloped that he can not generally understand it; and no farmer or farmer's son can study it thoroughly without being a better and more successful cultivator than before. Carefully Revised. Cloth. \$1.00.

**Money in the Garden.**—By P. T. Quinn. A Vegetable Manual prepared with a view to *Economy and Profit*. The author gives in a plain, practical style, instructions on kitchen garden, market garden, and field culture. Illustrated. \$1.50.

**Play and Profit in my Garden.**—By Rev. E. P. Roe. The author shows us how, after four years' experience, he evoked a profit of \$1,000 from his garden, and this while carrying on pastoral and literary labors. Cloth. \$1.50.

**Irrigation for the Farm, Garden, and Orchard.**—By Henry Stewart. This work is offered to those American Farmers, and other cultivators of

\* For titles and descriptions of over Three Hundred additional Rural Works, which we offer as premiums, send six cents to the *ORANGE JUDD CO.*, 245 Broadway, New York, for their *Illustrated Catalogue of Rural Books*, 1880. It comprises 80 large pages beautifully printed on tinted paper, contains 125 engravings, and makes a superb reference book for Architects, Artisans, Farmers, Florists, Fruit Growers, Gardeners, Housekeepers, Stock Raisers, etc. The books described in the above Catalogue, are furnished for premiums on the same conditions, as those enumerated in this Premium Sheet.

the soil, who, from painful experience, can readily appreciate the losses which result from the scarcity of water at critical periods, as well as to those enterprising pioneers whose efforts are showing it to be possible to reclaim from sterility the so-called "Great American Desert." Fully Illustrated. Tinted paper. Cloth. \$1.50.

**Gardening for the South.**—How to Grow Vegetables and Fruits. By Wm. N. White. An admirable treatise on gardening which ranks among the most useful horticultural works of the present day. Cloth. \$2.00.

### Fruits and Flowers.

**The Window Flower-Garden.**—By Julius J. Heinrich. The author is a practical florist, and this entertaining volume embodies his personal experiences in Window Gardening during a long period. All who desire to beautify their homes, especially during the winter months, should have this book. More than 70 illustrations add materially to the attractiveness of the work. Cloth bound, tinted paper. 75c.

**American Grape Growing and Wine Making.**—By George Husmann, Professor of Horticulture in the University of Missouri, with contributions from well known Grape Growers, giving a wide range of experience. The author of this volume is the recognized authority on Grape Growing and Wine Making in the United States. His reputation likewise extends all over Europe. The work is a complete guide for novices in the culture of the vine, also a summing up of everything of importance and value bearing upon this industry. In order to adapt it to all latitudes the author embodies the methods and opinions of eminent grape cultivators in all parts of the country. This volume is fully illustrated, handsomely bound, and is printed on tinted paper. \$1.50.

**New Books of Flowers.**—By Joseph Breck. The best work of the kind. 12mo. Neat cloth cover. \$1.75.

**Quinn's Pear Culture for Profit.**—By P. T. Quinn, Practical Horticulturist. If one wishes to raise pears intelligently, and with the best results, he must know first the character of his soil, the best mode of preparing it, the best varieties to select under existing conditions, the best mode of planting, pruning, fertilizing, grafting, and utilizing the ground before the trees come into bearing, and finally of gathering and packing for market. The hope of furnishing practical information on all these points has induced the author to endeavor to draw for others the same lessons which years of practical experience have afforded him. Illustrated. Cloth, 12mo. \$1.00.

**Grape Culturist.**—By Andrew S. Fuller. This is one of the best works on the Culture of Hardy Grapes. Fully illustrated, with engravings showing how to plant, train, graft, etc., etc. Bound in cloth, \$1.50.

**Practical Floriculture.**—By Peter Henderson. One of the most popular Guides to the successful Propagation and Cultivation of Florists' Plants. The work is thoroughly revised and enlarged by the addition of valuable matter. \$1.50.

**Small Fruit Culturist.**—By Andrew S. Fuller. This book covers the whole ground of Propagation, Culture, Varieties, Packing for Market, etc. Fully illustrated. Cloth. \$1.50.

**Winter Greenhouses at Home.**—By Rev. E. A. Johnson, D. D. A most excellent guide to successful House-gardening. Beautifully bound in cloth, black and gold. \$1.00.

**Ferns in their Homes and Ours.**—By John Robinson. A complete Practical Guide to the Amateur. Illustrated with full-page colored plates. Cloth. \$1.50.

**Every Woman Her Own Flower Gardener.**—A Handy Manual of Flower Gardening for Ladies. By "Daisy Eyebright." Paper covers, 50c.; cloth, \$1.00.

**Vick's Flower and Vegetable Garden.**—Profusely illustrated, and with six full-paged colored plates. Paper covers, 50c.; cloth, \$1.00.

**The Fruit Garden.**—By P. Barry. A most practical, comprehensive, and profusely illustrated work, treating fully on the cultivation of Fruits of every variety, and all the information required for successful fruit growing. Fully illustrated. Bound in cloth, and printed on tinted paper. \$2.50.

**Mohr on the Grape Vine.**—This is a very plain discussion of the structure of the Vine, and the principles involved in its pruning, training, and cultivation generally. By Prof. Frederiek Mohr. Illustrated. Cloth. 12mo. \$1.00.

**Parsons on the Rose.**—A Treatise on the Propagation, Culture, and History of the Rose. New and Revised Edition. The Rose is the only flower that can be said to have a history. It is popular now, and was so centuries ago. In his work upon the Rose, Mr. Parsons has gathered up the curious legends concerning the flower, and gives us an idea of the esteem in which it was held in former times. A simple garden classification has

been adopted, and the leading varieties under each class enumerated and briefly described. The chapters on multiplication, cultivation, and training, are very full, and the work is altogether one of the most complete before the public. Illustrated. By Samuel B. Parsons. Cloth, \$1.50.

**White's Cranberry Culture.**—By Joseph J. White, a practical grower. Contents:—Natural History.—History of Cultivation.—Choice of Locations.—Preparing the Ground.—Planting the Vines.—Management of Meadows.—Flooding.—Enemies and Difficulties Overcome.—Picking.—Keeping.—Profit and Loss.—Letters from Practical Growers.—Insects Injurious to the Cranberry. This is one of the very best and most practical works upon Cranberry Culture that have ever been issued. Illustrated. Cloth. \$1.25.

### Horses.

**The American Reformed Horse Book.**—By Prof. Geo. H. Dadd. A treatise on the Causes, Symptoms, and Cure of every Disease incident to the Horse, including all Diseases peculiar to America. Embracing also full details of Breeding, Rearing, and Management on the Reformed System of Practice. Cloth binding, full gilt black. \$2.50.

**Hints to Horse Keepers.**—By Henry Wm. Herbert (Frank Forester). A complete Manual to Horsemen. A complete guide to Breeding, Buying, Training, and using horses. It stands unrivalled among American books. Cloth. \$1.75.

**The Modern Horse Doctor.**—By Prof. Geo. H. Dadd. Containing practical observations on the Causes, Nature, and Treatment of Diseases and Lameness in Horses. Illustrated. Bound in cloth. \$1.50.

**The Percheron Horse.**—Translated from the French of Chas. Du Huys. A complete descriptive work on the various qualities of this breed of horse, including tests of endurance, speed, etc. Cloth. \$1.00.

**Miles on the Horse's Foot.**—By William Miles. The object of this book is to communicate in the most familiar language possible, the result of several years' observation and of much tedious experiment, undertaken with a view of ascertaining what mode of shoeing, system of stabling, and quantity of exercise promised the fairest prospect of preserving the foot of the horse in soundness and comfort to himself, and usefulness to others. Cloth. 75 cents.

### Cattle, Sheep, and Swine.

**Keeping One Cow.**—This work is a collection of Prize Essays, and selections from a number of other essays, with editorial notes, suggestions, etc. This new book gives the latest information, and in a clear and condensed form, upon the management of a single milch cow. Illustrated with full page engravings of the most famous dairy cows. Cloth. \$1.00.

**American Cattle.**—By Lewis F. Allen. Their History, Breeding, and Management. It explains how to improve Herds of American Cattle, by an orderly methodical system, and is the best practical Cattle Breeder's book. Bound in cloth. \$2.50.

**Swine Husbandry.**—By F. D. Coburn. A new and complete work on the Management and Breeding of Swine in large numbers for market. Fully illustrated. Cloth bound. \$1.75.

**American Cattle Doctor.**—By Prof. Geo. H. Dadd. Gives the necessary information for Preserving the health and Curing the diseases of Oxen, Cows, Sheep, and Swine, and many valuable recipes on Farm and Dairy Management. Bound in cloth. \$1.50.

**American Reformed Cattle Doctor.**—By Prof. Geo. H. Dadd. A complete work on all the Diseases of Cattle, Sheep, and Swine, embracing all Diseases peculiar to American Cattle, including the Cattle Plague and Trichina. Elegantly bound in cloth, gold back. \$2.50.

**Harris on the Pig.**—By Joseph Harris. A complete guide for raising the various English and American breeds of Swine, and the value of using thoroughbred stock for improving ordinary herds of Swine. Cloth. Fully illustrated. \$1.50.

**The Shepherd's Manual.**—By Henry Stewart. A new valuable and practical work, showing how to manage a Flock, treat every Sheep Disease, and to successfully breed Sheep for market. Cloth. Fully illustrated. \$1.50.

**Guenon's Treatise on Milch Cows.**—An interesting work, giving new and peculiar directions, and many illustrative engravings, for determining by natural marks or external signs, the quality and quantity of milk a cow will give, length of time she will continue in milk, etc., with introductory remarks of forty pages on the Cow and Dairy. Cloth. 75 cents.

**The Soiling of Cattle.**—By Josiah Quiney, with a Memoir of the Author. Illustrated from Experience, and an Address containing Suggestions believed to be useful to all farmers. This little book can not fail to be read with interest by farmers generally. \$1.25.

### Poultry.

**The Practical Poultry Keeper.**—By L. Wright. The Standard American Poultry Book. Cloth, Finely Illustrated. \$2.00.

**Poultry Breeding.**—By Geo. K. Geyelin, C. E. Teaching how to successfully raise Poultry on a large scale. Cloth. \$1.25.

**An Egg Farm.**—The Management of Poultry in Large Numbers. By H. H. Stoddard. A most valuable work. 75c.

**Saunders' Domestic Poultry.**—By Simon H. Saunders. A Practical Treatise on the Preferable Breeds of Farm Yard Poultry, their History and Leading Characteristics; with Complete Instructions for Breeding and Fattening, including Preparing for Exhibition at Poultry Shows, etc. Very fully illustrated. 75 cents.

**Wright's Brahma Fowl.**—Contents.—Chapter I. The Origin of Brahmas.—Chapter II. Economic Qualities and Management of the Brahma as a Stock Fowl.—Chapter III. Characteristics of Dark and Light Brahmas as Bred for Exhibition.—Chapter IV. The Practical Breeding, Rearing, and Management of Brahmas for Exhibition.—Chapter V.—The Judging of Brahmas. Elegantly illustrated. Cloth. \$2.50.

### Household Works.

**Skillful Housewife;** or, Complete Guide to Cookery, Household Duties, Care of Health, Education of Children, etc. 75 cts.

**Cooking School Text-Book,** and House-keepers' Guide to Cookery and Management. By Juliet Corson. \$1.25.

**What the Grocers Sell Us.**—A Manual for Buyers. By P. H. Felker. Containing the Natural History and Process of Manufacture of all Grocer's Goods; also their Adulterations, and How to Detect them; Rates of Tare, as allowed by Custom and Law; Tables of Weight, Measures, Money, etc. The whole being designed as a Guide to aid in the Purchasing of Goods, \$1.00.

**Books on Alphabets.**—Copley's Plain and Ornamental Alphabets, \$3.00.—Woodward's Fancy and Ornamental Alphabets, \$6.00.—Ames' Alphabets, \$1.50.

## Miscellaneous.

**Quinby's New Bee-Keeping.**—The Mysteries of Bee-Keeping Explained. Revised by L. C. Root. Combining the results of Fifty Years' Experience, with the latest discoveries and inventions, and presenting the most approved methods, forming a complete guide to successful Bee Culture. It is the latest and best work on the subject. Illustrated with one hundred engravings, and a portrait of the late M. Quinby. Beautifully bound in cloth \$1.50.

**Draining for Profit and Health.**—By Geo. E. Waring, Jr., Engineer of the Drainage of Central Park, New York. A revised and enlarged edition, treating fully and practically on the land to be drained. How Drains Act, How to Make Drains, What Draining Costs, Will it Pay? etc., etc. Nearly fifty illustrations. Bound in cloth \$1.50.

**Harris' Insects Injurious to Vegetation.**—By Thaddeus William Harris, M. D. Enlarged and Improved. With additions from the author's manuscripts and original notes. Illustrated by Engravings drawn from Nature by Charles L. Flint, Secretary of the Massachusetts State Board of Agriculture. This work is fully illustrated with two hundred and seventy-eight fine wood-cuts, and eight beautiful steel-plates, full-page size, containing ninety-five figures. Published in two beautiful editions; one plain, with steel engravings, extra cloth; the other in extra cloth, beveled boards, red

edges, engravings colored with great accuracy. Octavo. 640 pages. Plain, \$4.00. Cloth. \$6.50.

**Lyman's Cotton Culture.**—By Joseph B. Lyman. A complete manual for Cotton growing, for those not familiar with this crop. It discusses climate, the farm, stock, implements, preparation of soil, and planting, cultivation, picking, ginning, baling, and marketing, and gives a calendar of monthly operations. Also the extent of the cotton lands, the varieties of the cotton plant, insects and diseases that molest it, valuable statistics and suggestions, etc. An additional chapter has been prepared by J. R. Sypher, Esq., upon Cotton Seed and its Uses, giving the details of manufacturing the oil. The work contains a colored map of the Cotton Lands of the United States, besides other illustrations. \$1.50.

**Scribner's Lumber and Log Book for Ship Builders, Boat Builders, Lumber Merchants, Farmers, and Mechanics.** By J. M. Scribner. A. M. It gives correct measurement of Scantling, Boards, Plank, Cubical Contents of Square and Round Timber, Saw Logs, reduced to Board Measure, by DOYLE'S RULE, Specific Gravity and Weight of Different Woods, Capacity of Cisterns, Measurement of Wood and Price per Cord, Stave and Heading Bolt Table, Hints to Lumber Dealers and Mechanics in Selection of Standing Trees, Defects of Timber (especially Oak), and Felling Timber. Tables of Wages by the Month, Board or Rent by the Week or Day, Interest Tables, etc. 35 cents.

**The Tim Bunker Papers, or Yankee Farming.**—A quaint, most interesting book, giving the experiences, observations, etc., of "TIMOTHY BUNKER, Esq.," of Hookertown, Conn. No other book on American farming contains so much entertainment with instruction. Cloth. \$1.50.

**A History of the Menhaden.**—With an account of the Agricultural Uses of Fish, and an introduction bringing the subject down to date. By Prof. G. Brown Goode, Curator U. S. National Museum; Assistant U. S. Fish Commission; Author of "The Game Fishes of North America," etc.; and Prof. W. O. Atwater, Professor of Chemistry, Wesleyan University, etc. 30 plates. Cloth. \$2.00.

## Out-Door Sports and Pastimes.\*

**Practical Taxidermy and Home Decoration.**—By Joseph H. Batty, Taxidermist for the Government Surveys and many Colleges and Museums in the United States. 125 illustrations. An entirely new and complete, as well as authentic work on Taxidermy—giving in detail full directions for collecting and mounting Animals, Birds, Reptiles, Fish, Insects, and General Objects of Natural History. Cloth. \$1.50.

**How to Hunt and Trap.**—By Joseph H. Batty. An entirely new and comprehensive Sportsman's Guide for Hunting, Trapping, etc., including Wild Sports of the Wilderness, Mountain Shooting, Bear Hunting, and Trapping; Camping; the use of Mules, Dogs, Guns, Boats, Canoes, etc. Fully illustrated, handsomely bound in cloth, printed on tinted paper, \$1.50.

**The Dogs of Great Britain, America, and other Countries.**—Their Breeding, Training, and Management in Health and Disease, comprising all the essential parts of the two latest standard works, by STONEHENGE. It is the latest and most reliable Dog book, edited by the best informed American writers on the subject. It describes the best Hunting grounds in America. Gives names of prize winners at Dog Shows, and is illustrated with over one hundred excellent engravings, embracing some of the most noted dogs on both continents. The Chapters on the Management and Treatment of Diseases of Dogs, make it specially valuable to every owner of a dog. Handsomely bound in cloth, black and gold. Printed on tinted paper. \$2.00.

**Hallock's Sportsman's Gazetteer.**—The new edition, now ready, is full of valuable information on Hunting, Fishing, etc.; on the Game, Animals, Birds, etc., of North America, together with a directory of all the principal game resorts. Substantially bound in cloth. \$3.00.

**Practical Boat Sailing.**—By Douglas Frazer. Master of the "Maryland," Commander of the yacht "Fenimore Cooper," etc. The author claims that after reading this little volume through, a person may safely,

understandingly and successfully, handle any sailing craft. Neatly bound in cloth. \$1.00.

**Fish Hatching and Fish Catching.**—By H. B. Roosevelt, Commissioner of Fisheries of the State of New York, and Seth Green, Supt. of Fisheries of the State of New York. The author's names render a description of this work unnecessary, and it is needless to say that it is a valuable volume for sportsmen. Illustrated. Cloth. \$1.50.

**The American Sportsman.**—New edition.—By Elisha J. Lewis, M. D. Containing Hints to Sportsmen, Notes on Shooting, etc. Fully illustrated. Handsomely bound in cloth. Colored plate frontispiece. \$2.75.

**Hunter and Trapper.**—By Halsey Thrasher, an old and experienced sportsman. 12mo. Cloth. 75c.

**Frank Forester's American Game in its Seasons.**—Fully illustrated and described. 8vo. Cloth \$1.50.

**Field, Cover, and Trap Shooting.**—By Captain A. H. Bogardus. 12mo. Cloth. \$2.00.

**American Partridge and Pheasant Shooting.**—By Frank Schley. 12mo. Cloth. \$2.00.

**Trotting for Pike, Salmon, and Trout.**—By H. C. Pennell, Author of the "Modern Practical Angler," etc., etc. Illustrated. 12mo. Boards. 50c.

**Fly Fishing and Worm Fishing for Salmon, Trout, and Grayling.**—By the same author. Illustrated. 12mo. Boards. 50c.

**The Solitary Hunter, or Sporting Adventures in the Prairies.**—By John Palliser, Esq. 12mo. Boards. 80c.

**Frank Forester's Field Sports of the United States and British Provinces of North America.**—New Edition, containing numerous corrections and additions, with illustrations from nature, and a brief memoir of the author. In two volumes. 8vo. Cloth. Per volume \$2.00.

**Frank Forester's Fish and Fishing of the United States and British Provinces of North America.**—Contains 100 engravings. \$2.50.

**Frank Forester's Complete Manual for Young Sportsmen of Fowling, Fishing, and Field Sports.**—8vo. Cloth. \$2.00.

**How to Camp Out.**—By John M. Gould. 16mo. Cloth. \$1.00.

**Camp Cookery.**—By Miss M. Parloa. 18mo. Cloth. 50c.

**Canoe and Camera.**—By Thomas Sedgwick Steele. A Photographic Tour of Two Hundred Miles Through the Maine Forests. This is one of the most entertaining and exquisitely illustrated books of the season. It is the result of recent personal explorations by the author, Mr. Thomas Sedgwick Steele. It is embellished with sixty engravings of the very finest style, by well known artists, with new Maps of the State prepared expressly for this book, and the story is told in a thoroughly fascinating manner. The author's interesting description of a section of Maine which is now but little known, should give this book a wide sale, and draw to Maine a crowd of pleasure-seekers. Handsomely bound in cloth, black, and gold. \$1.50.

**Camps and Tramps in the Adirondacks, and Grayling Fishing in Northern Michigan.**—By A. Judd Northrup. A record of summer vacations in the wilderness. Those who are fond of the woods will be delighted with this new book. It bristles with information on shooting and fishing, and may be relied on as an accurate guide to all the chief points of attraction in this famous region, and gives valuable suggestions on Camping Outfits, Fishing, Hunting, etc., etc. Handsomely bound in cloth. 16mo. \$1.25.

**Trouting on the Brule River; or, Summer Wayfaring in the Northern Wilderness.**—By John Lyle King. The author is well known both for his literary labors and ardent love of the rod and gun. In this beautifully gotten up volume he narrates the adventures of himself and party during weeks of Camping Out in the wild regions of Northern Wisconsin and Michigan, along the Michigami, Paint, Trout, Brule, and Menominee Rivers, which abound in fish and game of every variety. The volume gives a general description of these sporting regions, which are beginning to attract general attention, presents a complete map of the same, and tells all about the best routes to get to them. 12mo. \$1.50.

**American Wild Fowl Shooting.**—By Joseph W. Long. New, Revised, and Enlarged Edition. Containing full and accurate descriptions of the Haunts, Habits, and Methods of Shooting Wild Fowl, Instructions concerning Guns, Blinds, Boats, and Decoys. The true history of Choke Bores, and a correct method of testing the shooting powers of Shot Guns. Fully illustrated. Cloth. Tinted Paper. \$2.00.

\* For titles and descriptions of nearly 200 additional works on Out-Door Sports and Pastimes, which we offer as Premiums, send five cents to the ORANGE JUDD CO., 245 Broadway, New York, for *Sportsman's Library of Standard Books*. It comprises forty large pages, tastefully printed on tinted paper, and is elegantly illustrated with over 100 spirited engravings, many of them drawn from life, and faithfully portraying the points and characteristics of Game Birds and Animals, Fishes, Horses, Dogs, etc. The books described in the Sportsman's Library are supplied as premiums on same terms as those enumerated in this Premium Sheet.

**No. 17.—Compound Microscope.**

This new instrument is a wonderful success, and is constantly receiving the strongest praise from many of the highest scientific authorities. It has all the chief parts of the most costly instruments, with several improvements, and is supplied with a **Camera Lucida**, enabling any one to throw upon paper, and easily sketch in large size, objects too minute to be seen by the unaided eye. It defines very clearly, and has a magnifying power up to 150 diameters, or many thousand areas. It is as valuable as any Microscope hitherto obtainable, with Camera Lucida, for **\$50 to \$100.** (A full descrip-

tion mailed to any one desiring it.) By means of new inventions and the use of machinery in constructing its parts, it can now be supplied at retail for only \$15, all complete, in neat Walnut Case, with sundry adjuncts, specimens, full directions for use, and Prof. Phin's Microscopic Treatise. (To subscribers to the *American Agriculturist*, for whom it was specially designed, it will be supplied for \$10.) It will be **PRESENTED** to any one obtaining *Ten* subscribers, at \$1.50 each. Expressage paid by recipient. No more interesting and valuable article for one's own use, or for a Holiday or other present, can anywhere be found. *One of these Microscopes should be placed in EVERY Public and Private School.* This Microscope is also of special utility to Physicians.

This Engraving shows only **ONE-HALF** of the Premium set.

**No. 18.—Complete Telegraph Apparatus for Learners and for Practical Use.**

A **GRAND PREMIUM** for **Two Boys or Young Men**, or **anybody**—also for **young Ladies** wishing to learn Telegraphy. The use of the telegraph is extending everywhere. It is but little work to learn its simple language, and then two persons can hold instant communication over any distance, long or short. Every growing boy and girl may well learn this language. Messrs. L. G. TILLOTSON & Co., of 5 and 7 DeY St., New York, the celebrated largest manufacturers of Telegraph Instruments in this country, are now making very complete and perfect working Telegraph Instruments, (see Engraving), with Batteries, etc., at a price so low as to place them within the reach of all. It will cost but little to put them up between houses, business shops, dwellings, and stores, farm buildings, etc. We have arranged for the following most valuable **PREMIUM SET**. Two Boys or Young Men, in any neighborhood, by getting this **double set**, can connect their homes, (1 to 15 miles apart, if they wish), and talk with each other, and at the same time learn to be able to use any telegraph, at any time, and anywhere. The complete Outfit will contain

**Two Sets** of Instruments, including Batteries, and Chemicals, with the 20 ohms fine wire helix for working up to 15 miles; *two extra* Batteries and Chemicals (enough to work  $\frac{1}{2}$  of a mile); *six* Glass Insulators, with Brackets used to nail up upon trees or buildings for carrying wire; *two* Manuals, giving full directions for putting up the apparatus, and instructions for learning and using. Cost \$12.00. We will **PRESENT** the whole **double** apparatus, as above, to any one sending us only 15 subscriptions, at \$1.50 each. (At \$5.00 expense for each extra house, three, four, or a dozen houses may be put in the same line.) Freight paid by recipient.

**No. 19.—Spy Glass or Pocket Telescope.**—(12 lines.)—Much the best one for the price we have ever seen. It defines and magnifies distant objects quite plainly. Made of fine drawn brass tubing, corded, with sun or storm shade; when closed up fits into a case, carried easily in the pocket. From J. CURLEY & BRO., OPTICAL INSTRUMENT DEALERS, 134 and 136 Nassau St., N. Y. *Five* subscriptions, at \$1.50 each, will secure this. [Or we will supply it for \$3.75, post-paid.]

**No. 20.—Spy Glass, 16 Lines.**—This is much larger and more powerful than No. 19, and like that is much the best instrument for the price that we have found in this country. It is cased in brass; corded; has sun or storm shade. Length when drawn out 37 inches. From same firm as No. 19. One obtaining *Twelve* subscriptions at \$1.50 each will secure this [or we will supply it for \$9.00.] Receiver to pay expressage.

**Nos. 21, 22.—A Good Opera Glass,** in Leather Case, of strong magnifying power, excellent for examining objects at considerable distances, seeing

ease for carrying in the pocket. It is also a good Sun or Burning-glass, concentrating the sun's rays to produce fire. Diameter of Lens,  $1\frac{1}{2}$  inches. Sent, post-paid, for \$1.20. *Presented* for *Two* subscribers at \$1.50 each.

**No. 24.—Columbia Bicycle.**—This is the leading and favorite Bicycle in this country; it is strong, well made, and finely finished; diameter of front

wheel 50 inches, rear wheel 18 inches, weight 47 pounds, and is supplied with Saddle Bag, Wrench, and Oil. From the POPE MANUFACTURING CO., 101 Summer St., Boston, Mass. *Seventy* subscriptions at \$1.50 each will secure this (or we will supply it for \$70.) Receiver to pay expressage. It is a very superior Bicycle.

**Nos. 25, 26.—Good Barometers** are very Useful to Everybody, now. The recent improvement in weather observations enables one to readily know what the weather is likely to be many hours in advance, and such knowledge is of great value in earing for crops, ani-

**No. 25.** mals, in planning work, etc. **No. 26.**

To almost every farmer, and to many others, a good Barometer will every year pay a very large interest on \$100.—To meet this want, the Publishers have arranged to supply one of the most accurate, simple, desirable, and cheapest **Mercurial Barometers** to be found in the country—just as good for all practical purposes as one costing a hundred dollars, or more, viz.: **Woodruff's Patent Portable Barometer**, manufactured by Charles Wilder, Peterboro, N. H. We have tested Mr. Wilder's work for many years, and can confidently recommend the barometer to all. The Barometers offered are so portable that they can be sent to any distance safely. — *Description*: **No. 25** is cased in finely finished, polished Black Walnut. Length, 3 feet; width of top and base, 4 inches; width of shaft, 2 inches; depth (thickness),  $1\frac{1}{4}$  inch, with pedestal,  $2\frac{1}{2}$  inches deep; mounted with metallic plates, Vernier scale, *Thermometer*, and index. Glass door over the face. Price reduced to \$12.—**No. 26** is in neatly turned Case of maple or Cherry. Length, 40 inches; diameter of base and top,  $2\frac{1}{2}$  inches. Shaft slightly tapering, about  $1\frac{1}{4}$  inch in diameter. Semi-circular glass face; mounted with metallic plates, Vernier scale, and *Thermometer*. Price reduced to \$8.—These Barometers will be securely packed, and forwarded direct from the manufactory to any address. (The cost of carriage, which will be small, to be paid by receiver.)—We present **No. 25** for 13 subscribers, at \$1.50 each; or **No. 26** for 10 subscribers.—[Or on receipt of the price we will forward either barometer.] Send to Mr. Wilder for a full description.

scenery, etc.—**No. 21**, in Jet, or in gilded (gold-plated) mountings as desired. Diameter of Object Lens, 15 lines ( $1\frac{1}{4}$  inch). Price, \$5.50. *Presented* for 7 subscribers at \$1.50 each.—**No. 22**, same as the above, but larger; Object Lens, 17 lines ( $1\frac{1}{2}$  inch), Jet mountings. Price, \$6. *Presented* for *eight* subscribers at \$1.50 each. If to go by mail, send us 25 cents for postage & packing.

(This cut is only half size.)

**No. 23.—Magnifying Glass, and Sun Glass.**—Of excellent quality, made by the BAUSCH & LOMB OPTICAL CO.; very useful to magnify all ordinary objects, printed matter, needle-work, cloth, plants, flowers, etc., etc. Closes in a neat polished hard-rubber

**No. 27.—The Perfected Type-Writer.**  
*Price Largely Reduced.*—One sits before a key-board, each key having a letter of the alphabet, or figure, or punctuation mark, and by simply touching the desired letters with the finger, the writing is done in regular plain printing, clear and distinct, and with great rapidity—on two or more sheets, if copies are desired for preservation. The paper moves along automatically with every letter touched. It is useful for all kinds of writing, letters, etc., etc. Every one should send to E. REMINGTON & Sons, 231 Broadway, N. Y., for a full description. We offer the No. 1 Type-Writer, price \$80, complete, on table, etc., to any one sending us 80 subscriptions to the *American Agriculturist*, at \$1.50 each, or we will supply one at the price named. Freight to be paid by recipient. Two other styles of Type-Writers are made, as will be seen described in the circulars obtained from Remington & Sons. We will present either of the other Type-Writers for a proportionate number of subscribers. This instrument offers a far more promising means of obtaining a livelihood by a lady, than a Piano, or any other implement. Most of the letters of this office are now written on this machine. An experienced writer will print off a letter about as fast as it can be dictated to him, and its rapid use is learned in a hundredth part of the time required to play the piano passably well. Many **Young Ladies** ought to secure this premium for use, by raising a club of 80 subscribers, which will not be difficult. Some ladies have each secured that many subscribers for us in a very few days.

**No. 28.—Thermometer.**—Fancy Black Walnut Case, length 8 inches, made by CHAS. WILDER.

From same firm as No. 25. Two subscriptions at \$1.50 each secures this post-paid [or we mail it for \$1.25 p.p.]

**No. 29.—Rubber Pocket Stamps.**—(Scott's Patent)—Simple, Effective, Useful, Convenient, and Most Desirable—always inked and ready for use. Fig. a shows a nickel plated case (full size), to be carried in the vest pocket. It can be used as it is, or a pencil can be put in the stem as a handle.—Fig. b shows the same with the cover turned back for use. This cover has a pad that inks the rubber type every time it is closed, so that it is always ready. The rubber type is on a separate slide, which can be slipped out, and others put in, and may have 1, 2, 3, or 4 lines of type on it.—Fig. d is a print from a vest Pocket Stamp, like one we have carried for 15 months, using it to mark clearly anything desired, and also save carrying a pocket full of cards.

(29) Pocket Stamp closed—(full size).

(29) Pocket Stamp open.

RICHARD ROE,  
 New York City.

These stamps can be used without new inking from 1 to 3 months, and for re-inking a can of carmine ink goes with each stamp for replenishing the pad occasionally. Every business man will find these Stamps a great convenience, in place of ordinary business cards, for marking parcels, etc. The Rubber type is very durable, and, being elastic, prints well on hard surfaces also.—For Two subscriptions at \$1.50 each, we will present, post-paid, No. 29 with one line of any name as desired [or send it

post-paid for \$1.25]. (For each additional line of type 25 cents extra, giving address, or business, or both.) [NOTE.—For 46 cents extra, we will send with No. 29 an extra slide, with one line of rubber type (any full name desired), and bottle of indelible ink, for marking linen, clothing. These are made by S. B. SCOTT & Son, 194 Broadway, N. Y.]

**No. 30.—Shaving Set.**—This consists of a pair of fine Steel Razors, made by Joseph Rodgers & Sons, Sheffield, England, packed in a leather case, one of Goldschmidt's Razor Strops, and a Shaving Brush. From J. CURLEY & Bro., 134 and 136 Nassau St., N. Y. Price, \$5.75 for the set. Seven subscriptions at \$1.50 each, will secure this [or we will send the set for \$5.75]. Sent by mail, post-paid, in either case.

**No. 31.—French Cook's Knife, Fork, and Steel.**—This is a long (10 in.) thin Knife, with Celluloid or Patent Ivory Handle, warranted not to crack in hot water, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match, and the fork is supplied with the very convenient patent rest. It would save many wry faces, and perhaps hard words, were it in general use. Supplied by the MERIDEN CUTLERY Co., 49 Chambers St., New York. Six subscribers to the *American Agriculturist* at \$1.50 each, will secure the whole free. [We will supply the set for \$4.50.] Receiver to pay expressage.

**No. 32.—Butcher's Knife and Steel.**—These are made of the best steel, have wood handles;

the Knife Blade is 6 1/2 inches long, and the Steel 10 inches. From same firm as No. 30. Two subscriptions at \$1.50 each will secure these post-paid [or we will supply them and send them for \$1.35].

**Nos. 33, 34, 35.—American Table Cutlery.**—Useful, very desirable, well tempered, and wanted by everybody! We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign make. The MERIDEN CUTLERY COMPANY, who supply them to us, recommend these Knives as equal to any Cutlery in the market, and their recommendation is a guarantee wherever they are known. We offer two kinds of Knives, and three sizes of each kind. No. 33 have Rubber Handles, which are actually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Premium 33 is the Desert or Tea size, sold at \$14.75 per dozen. We present of these twelve knives and twelve forks to any one sending only 16 subscribers at \$1.50 each... For 17 subscribers, at \$1.50 each, we will give either the medium size, or the large Dinner size, sold at \$15.70.—Premium 34 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful articles; they are the Tea or Dessert size, which, with forks, sell at \$18.50. Only 19 subscribers, at \$1.50 each, secures these... For 22 subscribers at \$1.50 each, we will send the medium size, or the Dinner size, sold at \$21.20... For 23 names, at \$1.50 each, we will send the larger Dinner size, sold at \$22.50. The Forks, which accompany these Premiums, (Nos. 33 and 34), are made of genuine Albata, and war-

ranted double-plated with coin-silver. These Forks are furnished to us by the MERIDEN CUTLERY Co.... Premium 35, the Carving-Knife and Fork (given for only 5 subscribers), are made by the MERIDEN CUTLERY Co., with fine Celluloid Handles. Price \$3.50. They are beautiful, and serviceable articles for daily use. These premiums are very useful and desirable, and have been secured by many persons in past seasons. —[We will send any of the above named articles, on receipt of the price specified, in cash, or a set of six for half the sum named.] Purchaser to pay expressage.

**Nos. 36 to 40.—Pocket Knives.**—HERE'S FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one, for merely a little effort. Any boy or girl can easily collect the few subscribers required to get one of these fine premiums free. These knives are furnished by the MERIDEN CUTLERY Co., 49 Chambers St., New York, whose work is equal to any done in this country or Europe. No. 36 is a neat, substantial \$1.00 Knife, four blades and stag handle, given post-paid for only 2 subscribers at \$1.50 each.—No. 37 is a similar Knife of extra quality, price \$1.50, given post-paid for only 3 subscribers at \$1.50 each.—No. 38, a \$2.00 Knife, Pearl handle, given post-paid for 3 subscribers at \$1.50 each.—No. 39, a \$2.75 Knife, five blades, Pearl handle, sent post-paid for only 4 subscribers at \$1.50 each.—No. 40, Ladies' four-blade, Pearl handle, \$2.00 Knife, given post-paid for 3 subscribers at \$1.50 each. [Any of the above Knives will be supplied post-free for the price named for each.]

**Nos. 41 to 45.—Pocket Knives.**—All Knives, whether sold or given as premiums, will be sent post-paid, or in "Registered Mail" if 10 cents be sent us. No. 41.—Pocket Knife, 4 Blades. Stag or Ivory handle. Price, \$1.00. Two subscriptions, at \$1.50 each, will secure this. [Or we will send it for \$1.] No. 42.—Pocket Knife, 4 Blades. Larger size. Stag or Ivory handle. Price, \$1.25. Two subscriptions, at \$1.50 each, will secure this. [Or we will send it for \$1.25.] No. 43.—Pocket Knife, 4 Blades. Pearl or tortoise-shell handle. Three subscriptions, at \$1.50 each, will secure this [Or we will send it for \$1.50.] No. 44.—Pocket Knife, 4 Blades. Larger size. Pearl or tortoise-shell handle. Three subscriptions, at \$1.50 each, will secure this. [Or we will send it for \$1.75.] No. 45.—Pocket Knife, 4 Blades. Pearl or tortoise-shell handle. Three subscriptions, at \$1.50 each, will secure this. [Or we will send it for \$2.] All the above Premiums (Pocket Knives), are furnished by J. CURLEY & Bro., 134 and 136 Nassau St., N. Y., and all made by Joseph Rodgers & Sons, Sheffield, England.

**No. 46.—Multum in Parvo Pocket Knife.**—Boys, Read this. Yes, and the Men, too. The Editor thinks more of this than any other article of twice its cost. He obtained one in London just thirteen years ago, which he still carries, and says it far more than pays the interest on \$100, (2 cents a day,) for, aside from its ordinary use as a double-bladed knife, some one of its

Premium 46 [Open.]

"tools" is often worth a "quarter," by being on hand and just the thing wanted in an emergency. He sent an order to England at three different times, but only received much larger, clumsier articles, less effective, and costing \$5 each, and finally learned that the original maker was dead. He then got some English cutlery here to make them, but they did not always succeed in keeping up a supply of first-class articles. We now get them all right of the MERIDEN CUTLERY COMPANY, and much cheaper than any imported. The Engraving shows the parts of the knife, except

Premium 46 [Closed.]

the very convenient and very effective *Screw-driver* hidden by the opened large blade. The *Saw* is double-toothed, and will cut an inch board, saw off a good-sized stick, cut a notch, etc. The *Hook* is used to lift a stove-cover, pry open sundry things, clean a horse's hoof, pull on the boots, etc. The *Punch* makes holes in harness, wood, etc., which can be enlarged by its sharp corners. The *Gimlet* and *Corkscrew* are convenient, of course. The *Tweezers* and long *Pointer*, or *Brad-awl*, drawn from the end of the handle, often come into use. The back of the *Hook* makes a good *Hammer* for tacks, and small pounding. The inside of the *Hook* forms a small *Nut-cracker*. All close into a compact white handle, the whole weighing only 2 ounces. IT IS A POCKETFUL OF TOOLS. This year only five subscribers at \$1.50 each brings it free, post-paid.—[We will send one, post-paid, for \$4.00.]

**No. 47.—Sportsman's Knife.**—Made by Geo. Wostenholm & Son, of England. Stag handle; length, 3½ inches; contains *Screw-driver*, two knife and one saw Blade, hook, punch, gimlet, corkscrew, tweezers, pointer, brad-awl, and lance. From same firm as No. 48.—Four subscriptions, at \$1.50 each, will secure this. [Or we will supply it for \$3.25.] Sent post-paid.

**No. 48.—Pruning Knife.**—Made by Joseph Rodgers & Sons, Sheffield, England. Stag Handle. From J. Curley & Bro., 134 and 136 Nassau St., N.Y. Two subscriptions at \$1.50 each, secures this post-paid [or we mail it for \$1.25 p.]

**No. 49.—Pair of Knife Rests.**—Very neat and convenient little things for any dining table, being receptacles for the carving-knife when it is not in use.

They are made of steel, and nickel-plated. Made by H. M. QUACKENBUSH, Herkimer, N. Y. One new subscription, at \$1.50, will get these. [Or supplied for 75c.] If to go by mail, send us 6 cents for postage & packing

**No. 50.—Two Premiums in One.**—1st.—Silver's Glass Measuring Jar and Egg Beater; will be found very useful in the household. It is an accurate Measurer and Weigher, and is also used as an Egg Beater.—2d. Lemon Squeezer. This is made of metal that will resist the acid, and is strong and durable. From J. H. BALDWIN & Co., 21 Murray St., New York.

Two subscriptions at \$1.50 each, will secure both of these [or we will supply both of them for \$1.50.] Receiver to pay expressage.

**No. 51.—Worcester's Pocket Dictionary.**—(Over 18,000 Words.) Here is a *Great Convenience* for every one—a Neat, Handy Dictionary, in firm, flexible-cloth binding; size, 3½×4½ inches; **313 pages**; very clear print, for old eyes even—just the book for use, and easily carried in the pocket. It contains over **18,000 words**, Abbreviations, Rules for Spelling, Pronunciation, Spelling and Definition of Words, many valuable Numerical Tables, etc. Also over 100 Engravings. (These are small, but very useful in illustrating words.) The above Pocket Dictionary will be sent post-paid to every one who will forward one new subscriber for the *American Agriculturist* at \$1.50. To every one who forwards three new subscribers at \$1.50 each, we will present, post-paid, four copies of this Pocket Dictionary,—one for himself, and one for each of the new subscribers.—Of course, in this, as in all other cases, the names can count on no other premiums.

**No. 52.—Webster's Pocket Dictionary.**—Iverson, Blakeman, Taylor & Co.'s Edition. This volume is abridged from the American Dictionary of Noah Webster, LL.D. By William G. Webster and William A. Wheeler. It embraces a careful selection of about 18,000 of the most important words of the language, and is illustrated with nearly 200 engravings on wood. Bound in cloth, illuminated sides. Price \$1.00.—This will be sent for Two new subscriptions at \$1.50 each.

**WORCESTER'S ILLUSTRATED QUARTO DICTIONARY**

**No. 53.—A Grand Premium.**—The offer of this Premium is open only to Jan. 1, 1881. [Presented now for only ten subscriptions.] A large, handsome Volume of 1854 pages, containing considerably more than 100,000 words in its Vocabulary, with the correct Pronunciation, Definition, and Etymology. Fully illustrated and unabridged. Four full-page illuminated plates. Bound in library sheep, marbled edges. Price, \$10.00. Most of the thoroughly educated men of the country consider this as by far the best Dictionary in the English Language. It is now regarded as the STANDARD AUTHORITY, and so recommended by Bryant, Longfellow, Whittier, Sumner, Holmes, Irving, Winthrop, Agassiz, Marsh, Henry, Everett, Mann, Stephens, Quincy, Felton, Hilliard, Memminger, and the majority of our most distinguished scholars. As a source of general information, this grand volume stands next to the Universal Cyclopædia. It should be in every family. It is offered on far more favorable terms than ever before. Let a multitude of Boys, and Young Men, each get only 10 subscribers, at \$1.50 each, for which we will present this invaluable work. A great many have done so in the past, when many more subscribers were needed to obtain it free. It is worth trying for all winter; but you can get subscribers enough in a week (only ten) to obtain it free. It is published by Messrs. J. B. LIPPINCOTT & Co., Philadelphia.—[We will supply this Dictionary for \$10.00.] It can be taken at the office, or sent by express.—The carriage to be paid by the receiver.

**No. 54.—Daisy Printing Press.**—The Press is made of Malleable Iron, japanned in black, and ornamented. The Outfit consists of the Press, one Composition Ink Roller, one can best Card Ink, one Daisy Composing Pallet, one font fancy Card Type, including spaces and quads. The whole packed in a wooden box, with sliding cover, with full directions to Amateurs.—A good thing for boys. Three subscriptions at \$1.50 each, will secure this [or we will supply it for \$2.00.] The receiver to pay expressage.

[Most desirable for the Family Table; also a Marriage Gift, Holiday or other Gift to a Son, Daughter or Friend.]

**Nos. 55 and 56.—Magnificent Family Bible (Pictorial).**—(A large number of these sent out last year gave great satisfaction.) Over 1,400 Pages; and Illustrated with 2,500 Engravings, on Steel and Wood, by Gustave Doré, and other celebrated artists; large, very plain type; illuminated title pages, Lord's Prayer and Commandments. It contains excellent maps of Holy Land, etc.; complete and partial Household Dictionary of Antiquities, Biography, Geography, and Natural History, by Wm. Smith, LL.D.; Maps and Illustrations and Panoramic Views of Holy Land, Jerusalem, Wilderness, Mt. Sinai, etc., etc.; History of all existing Religious Denominations, and Ancient and Modern Sects; History of English Bible; a large Concordance; full Marginal Notes and References on every page; contents of Old and New Testaments arranged for reference to any subject or occurrence; Chronology; Harmony of the Gospels, and many other useful features too numerous to recapitulate here; making it one of the most complete and useful Family Bibles ever issued—a real Biblical Cyclopædia. It has also a very elegant Marriage Certificate in seven colors, and a unique Family Record, also in colors, etc., etc. No. 55 is bound in Turkey Morocco, deep panelled, beveled edges, full gilt on edges, sides and back (see engraving). Price, \$12, including receiver's name, gilt in one line. (Other lines added in gilt for 20 cents per line). Weight, about 13 lbs.; expressage or freight to be paid by purchaser. This magnificent Bible will be PRESENTED to any one sending 13 names at \$1.50 each, expressage, gilding names, etc., as above.—No. 56.—The same Bible as the above in every way, with raised panels, gilt edges, etc., except that the binding is in French Morocco, and the sides are plain, instead of full gilt—which some prefer. Price \$10; weight, expressage, gilding names the same as No. 55. This will be PRESENTED for only 11 subscribers at \$1.50 each. These splendid Bibles will also be supplied at the prices above named.

**No. 57.—Bonanza Printing Press.**—The Press is made of Malleable Iron, japanned in black, ornamented with red and gold stripes. The outfit consists of Press, one Brass Composing Pallet, one two-inch Composition Roller, one box Wade's Best Card Ink, one set Spacing Reglets, one Pack White Bristol Cards, and a full 2A 3A font of Fancy Card Type, including Spaces and Quads, which will print a name or one line of type. The whole packed in a wooden box, with sliding cover, with full directions, How to Print and Set Type. From same Company as No. 111. Four subscriptions, at \$1.50 each, will secure this.—[Or we will supply it for \$3.00.] Expressage to be paid by the recipient in either case.

**No. 58.—100 Assorted Stereoscopic Views.**—From STERN & LYON, 20 Park Place, N. Y. Seven subscriptions at \$1.50 each will secure these [or we supply them for \$6.00 and send them post-paid.]

**No. 59.—50 Assorted Stereoscopic Views.**—Four subscriptions at \$1.50 each will secure these post-paid [or we will supply them post-paid for \$3.]

**No. 60.—Bound Volumes of the American Agriculturist.**—We have Electrotpe Plates of the *American Agriculturist* since 1857, and can print and bind any number of new volumes. These **23 Large Volumes** contain a vast amount of most *Useful and Practical Information*, collected by a great number of *active, earnest, intelligent, practical Men and Women*, and illustrated with **many thousands of beautiful, pleasing, and instructive Engravings**, that have cost over **Two Hundred Thousand Dollars**. These Volumes are alone a *large and valuable Library*

FOR THE

**FARM, GARDEN, AND HOUSEHOLD,** and *kindred Subjects*, containing more varied information on all those matters than can be found in books that would cost **five times the price of these**. Each of these **23 Volumes** has a full Alphabetical Table of Contents, for readily referring to any article or subject in the Volume. They are neatly Bound in uniform style, with gilt title, etc.; they are very convenient, and will finely adorn the Book-Case or Table. The price of these volumes, neatly bound, is \$2.00 each, or sent post-paid for \$2.30. To every person who is himself a subscriber we will present and send post-paid, any One of the above volumes, in return for every three new subscribers he will send at the regular subscription price of \$1.50 each. The receiver of the Premium can make his own selections from any of the volumes back to 1857.

**No. 61.—Ink-Stand.**—Single with Thermometer. Diameter, 5½ inches. Height, 9½ inches. From the same firm as No. 92. Price, \$1.00. 2 subscriptions at \$1.50 each, will secure this [or we will supply it for \$1.00]. This is a very fine arrangement for the low price at which it is supplied. It can not be sent by mail. It can be taken at the office, or sent by express anywhere, as it is well packed in a box. The express expense will be light, and is to be paid by recipient.

**No. 62.—Ink-Stand.**—Double, with pen-rack; length, 10½ inches; height, 5½ inches. From the same firm as No. 92. Price, \$1.00. Two subscriptions at \$1.50 each will secure this [or we will supply it for \$1.00]. Express charges to be paid by recipient in either case.

**No. 63.—Clock "Gerster."**—Rosewood

Case, with fancy glass front. Height 18½ inches, eight-day and strike. An elegant and most desirable time-piece. From E. N. WELCH MANUF'G CO., 6 Warren St., N. Y. Fifteen subscriptions at \$1.50 each will secure this [or we will supply it for \$13.] Receiver to pay expressage or freight. It will be carefully boxed, without extra charge, and go safely to any distance by express or freight.

**No. 64.—Office Clock and Inkstands.**—This beautiful combination of the useful and ornamental will prove a very acceptable present in many cases. It is 7½ inches in height, and 8 inches in width. It comprises a handsome silver-plated clock, supported by a gold-plated figure, with two ornamental inkstands, pen-rack, etc. On the dial are indicators of the day of the week and of the month; is a stem-winder, hands set at the back, and a good time-keeper. From the ANSONIA CLOCK CO., 19 and 21 Cliff St., New York. Nine subscriptions at \$1.50 each are required to get this elegant Premium. [We will send one on receipt of \$7.50.] Express to be paid by recipient.

**No. 65.—Pocket Ink Stand.**—Made of Brass, covered with Russia Leather and having a spring cover. From WILLY WALLACH, 36 Park Row, N. Y. Two subscriptions at \$1.50 each will secure this post-paid [or we will mail it for \$1.50 p.p.].—A very handy article to carry in traveling, or to keep in the desk, closed when not in use, so that it will not spill the ink if upset accidentally.

**No. 66.—Clock "La Banniere"** (Banner Clock).—This is an Alarm, Stem Winder, and will run thirty hours. Height, 9¼ inches. Gilt Stand, front and back protected by close-fitting Caps, to prevent dust from getting in the works. From E. N. WELCH MANUFACTURING CO., 6 Warren St., N. Y. Price, \$5.50. Seven subscriptions at \$1.50 each will secure this. [Or we will supply it for \$5.50.] Expressage to be paid by recipient.

**No. 67.—Girl's Writing-Desk.**—This has a wood frame, covered with Leatherette, and lined inside with paper to imitate Wood; outside is handsomely decorated on top in silver and gilt. Length, open, 14

inches; width, 10 inches; it has Lock and Key and two Ink-Bottles. From KOCH, Sons & Co, 156 William St., New York. Three subscriptions at \$1.50 each, will secure this [or we supply it for \$2.00]. Expressage to be paid by the recipient.

**No. 68.—Jewel Box.**—This is the same as No. 70, with Tray extra and Lock and Key. From same firm as No. 58. Two subscriptions at \$1.50 each, will secure this post-paid [or we will mail it p.p. for \$1.50].

**No. 69.—Handkerchief Box.**—This is the same as No. 70, but consists of two boxes, one fitting inside the other. From same firm as No. 58. Three subscriptions at \$1.50 each, will secure this post-paid [or we send it post-paid for \$2.00].

**No. 70.—Glove Box.**—This is Japanese, lacquered in black, handsomely inlaid with colored pearl. From same firm as No. 58. 2 subscriptions at \$1.50 each, will secure this [or we will supply it for \$1.25 post-paid].

**Nos. 71 to 74.—Mark Twain Scrap Books.**—Almost everybody can find good use for a Scrap Book, and the collections made in one often become of great interest and value to the owner. We have

made arrangements with Messrs. DANIEL SLOTE & Co., 119 William St., New York, to supply the well known and highly approved Mark Twain Scrap Books. It is often found that, paste or mucilage not being at hand when wanted, the plain page Scrap Book is of no service whatever. With a Mark Twain Scrap Book no such difficulty occurs. In all the books, the gummed col-

umns are arranged for either short or long clippings. A clipping the length of a column may be secured by slightly moistening the upright lines, and for short extracts the cross lines may be used. The gummed lines generally serve as guides for placing the scraps.

No. 71.—MARK TWAIN SCRAP BOOK, 80 pages; size, 8½×11 inches; full cloth binding. This will be presented by us, post-paid, for 2 subscribers, at \$1.50 each. [Or we will supply one, and send it post-paid, for \$1.45.]

No. 72.—With 76 pages; size, 9×11½ inches; full cloth. We present it for 3 subscriptions, at \$1.50 each. [Or we will supply one, and send it post-paid, for \$1.90.]

No. 73.—With 100 pages; 9×11½ inches; cloth and gold binding; fancy stamp. Will be presented by us for 4 subscriptions, at \$1.50 each. [Or we will supply one for \$2.50.] Expressage in either case to be paid by receiver.

No. 74.—With 150 pages; 9×11½ inches; cloth and gold binding; fancy stamp. Will be presented by us for 5 subscriptions, at \$1.50 each. [Or we will supply one for \$3.25.] Expressage in either case to be paid by receiver.

These and the Art Scrap Books which follow, are beautiful and useful for Holiday Presents.

**Nos. 75 to 77.—Art Scrap Books.**—Patent Back, Adhesive Page. Admirably adapted for the preservation of Scrap Pictures, Unmounted Photographs, Chronos, and Pictures of any description. The whole page is gummed with a patent preparation, imperceptible to the eye, but by means of which any article may be pasted in, leaving the uncovered portion of the page in its natural tint. They are supplied to us by Messrs. DANIEL SLOTE & Co., 119 William St., New York City.

No. 75.—76 pages, 6×8½ inches. Sent post-paid by us for 2 subscriptions at \$1.50 each [or for \$1.25].

No. 76, with 76 pages, 8½×11 inches. Sent by us post-paid for 3 subscriptions at \$1.50 each [or for \$2.30].

No. 77, with 100 pages, 10¼×13 inches. Supplied for 4 subscriptions at \$1.50 each [or for \$3.00]; but for this style expressage must be paid by Receiver. All of these, and especially the last two, are elegant presents.

Premium 78

**Nos. 78 to 81.—GOOD WATCHES.**—A very good report comes generally from hundreds of our readers who obtained the watches we were able to offer last year. As there has been no change in the price of gold and silver, or in prices abroad, we are happy to announce that we can continue to offer the same Watches, and on the same terms as last year, so that hundreds of others can get them this year. A large supply has been ordered made in advance, and we hope to meet all calls more promptly than was the case last year.

**No. 78.—A GOOD WATCH.**—This is a **Stem Winder and Stem Setter**, needing no key or opening to admit dust. Dial clear, with Second Hand (see engraving above). Crystal strong, thick, flat, with the *new beveled edges*; Case strong, good looking, heavily nickel-plated, a *good resemblance to silver*. Weight, 4½ ounces. It is the best *time-keeper* for a \$10 Watch we have ever found. This has been supplied two years with general satisfaction. We continue to offer this as a premium for 13 subscribers at \$1.50 each, for supply it for the price, \$10]. There are as *good looking* watches sold for \$7 to \$9—but we have never found another *equally good time-keeper* so low as \$10.

**No. 79.—EXTRA SILVER WATCH.**—This is of the same *pattern* as the above, and made by the same Company in Switzerland, but the case is *Coin Silver*, and the works are of extra **HIGH GRADE**, with 13 *Jewels*, Compensated Balance, etc.—as good a Watch as any \$30 or \$40 watch we have ever seen. It is good enough for anybody. Face about 1½ inch in diameter. We offer this Watch with the utmost confidence, that it is one of the *best and cheapest* Watches ever supplied for the low price of \$15, which is so near the *actual cost of making*

that we can at best offer it for 20 subscribers at \$1.50 each, and do not care to furnish it at this rate, except where such a Watch is specially desired by our friends. [We will supply them to purchasers for the low price of \$15.]

**No. 80.—EXTRA SILVER WATCH, for BOYS or for MEN** who want a smaller Watch. This is every way like No. 79, **EXCEPT** that it is of *smaller size*, the face being about 1¼ inch in diameter. The cost is the same except that the smaller case requires a little less silver. This we *present* for 19 subscribers at \$1.50 each. [Or, we will supply it to purchasers for \$14.50].

**No. 81.—EXTRA SILVER WATCH, HUNTING CASE.**—(Heavy Coin Silver Case). This is *precisely the same watch every way* as No. 79 above, **EXCEPT** that it is in "Hunting Case" as shown in engraving. It will be presented for 22 subscribers at \$1.50 each. [We will supply it for the price, \$16].

**TAKE NOTICE, about ALL the above Watches, (Nos. 78 to 81).** THAT we can not agree to supply all that may be called for, though we expect to do so. They are manufactured with special care, in one of the best establishments in Switzerland, and can not be obtained or made rapidly. We have a

Premium 81

large lot ordered, which will come along from time to time hereafter, and they will be delivered as fast as they arrive, in the order in which applications for them come in paid for, either by premium clubs, or in cash. Those desiring to secure any one of these watches at once as a premium, can send in the *price* and receive it, and when he afterwards raises the full premium club, the price can be deducted from his final remittance. The recipient will pay the expense of expressage. Or we will send either by mail for twenty-five cents extra.

**No. 83.—Houchin's Improved Patent Pocket Cook Stove.**—With Gridiron and Boiler (with folding handles) holding nearly one quart, which can be used as a drinking cup, which will boil water in five minutes to make two or three cups of Tea, Coffee, or Chocolate; to Boil Eggs, Stew Oysters, etc. Pour about two tablepoonsfuls of alcohol through the wire ganne, and light with a match or taper. The Lamp being filled with an indestructible packing will not spill or explode. Send *two* subscribers, at \$1.50 each, and get it *free*, post-paid. These stoves are made by McCox & SANDERS, 132 Duane Street, New York. —[We will supply and send one, post-paid, for \$1.25.]

**No. 84.—Houchin's Revolving Grater.**—Just the thing for horseradish, pumpkins, squash,

cocoanut, and other vegetables. From McCox & SANDERS, 132 Duane St., N. Y. *Two* subscriptions at \$1.50 each will secure this post-paid (or we mail it for \$1 p.p.)

**No. 85.—Universal Clothes Wringer.**

—(See Engraving above).—A very *useful, time-saving, strength-saving, clothes-saving* implement, that should be in *every* family. Here is a thing that is of *great value*, "and no mistake about it." It will pay for itself several times a year, in any family. The wringing out of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and *breaks* the fibres with *lever power*. With this Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the articles. A most important feature of this Universal Clothes Wringer is the peculiar *cog-wheel* arrangement, which makes both rollers turn together, and always keep their place. Without these, the crank-roller will slip, and pull the fibres, and injure the fabric. A multitude of letters of thanks for these Machines, given by us as Premiums, have been received. It is easy to gather at the regular rate of \$1.50 each, only 10 subscribers, and this will secure a *present* of one of these very valuable \$7.50 Universal Wringers. They are made by the METROPOLITAN MANUFACTURING Co., and furnished by R. C. BROWNING, 32 Cortlandt St., N. Y. [We will supply one of these valuable machines on receipt of the price, \$7.50]. Receiver to pay expressage.

**No. 86.—Doty's Improved Clothes Washer.**—Made with the Metropolitan Balance Weight. Over seventy-five thousand families are using this Washing Machine in the U. S. Made by the METROPOLITAN MANUFACTURING Co., 32 Cortlandt St., N. Y. *Seventeen* subscriptions at \$1.50 each secures this (or we supply it for \$14.) Receiver to pay expressage.

**No. 87.—Cornwall's Patent Broiler.**—Made of Iron, and is provided with a Gravy Pan, which receives the juices of the meat, and prevents any dripping into the fire. Fits over any stove, and broiling is done with a moderate heat. From same firm as No. 50. *Two* subscriptions at \$1.50 each, will secure this (or we will supply it for \$1.50.) Receiver to pay expressage.

**No. 82.—Hot-Blast Oil Stove.**—The engraving represents one of Whitney & Hall's Patent Hot-Blast Oil Stoves, made by the WHITNEY MANUFACTURING Co., of 1123 Chestnut street, Philadelphia. The cut represents the stove proper, with extension top and oven. With one of these articles, we are assured that the entire cooking can be done for a small family at mere nominal expense, by the use of kerosene oil. Besides the ordinary cooking, it can be used for heating sad-irons, baking, etc., doing the work as well, with very much less heat, than an ordinary cook stove. For 15 subscriptions at \$1.50 each, we will furnish a stove, an extension top, large oven, large broiler, and sad-iron heater (or will forward one for \$13.75), the receiver to pay the expressage.

Prem. 88.—ORGUINETTE "C."

**No. 88.—"The Orguinette."**—A Capital Musical Instrument for the million—for those who have had no time or opportunity to learn to play, yet who desire music in the house—at far less expense, and in far greater variety than is supplied by the Music Box, or Hand-Organ. The *Orguinette* has the usual Parlor-Organ or Melodeon reeds, with a small, but effective wind-bellows, and in sweetness of tone, brilliancy, promptness of action, etc., is quite remarkable for a musical instrument of so moderate a cost. The notes are most ingeniously and yet simply produced by the passage through the instruments of strips of perforated paper, the apertures so arranged as to open the keys and produce just the notes, and length of sound on each, required by the pieces played. These may be church music, lively sounding airs, national, and operatic selections, quadrilles, etc. The prepared perforated paper is sold at low rates (6½ cents per foot), and from the catalogue one may select any amount and variety of tunes desired, and at small cost. Any one desiring further description of the instrument, can send for circulars to the MECHANICAL ORGUINETTE Co., No. 831 Broadway, New York. We offer two varieties. Premium No. 88, the ORGUINETTE "C" (illustrated in the engraving), has the "Expression Box," giving a variety of pleasing effects, by simply raising and lowering the lid. 14 feet of the perforated music paper go with this. This will be presented for 15 subscribers at \$1.50 each. [It will be supplied complete by us, for \$14.00], expressage to be paid by the receiver....

ORGUINETTE "A."

**No. 89** is the ORGUINETTE "A," differing from "C" in the omission of the "Expression Box." Price with 14 feet of music paper, \$8.00, for which price we will supply it; or we will present it for 10 subscribers at \$1.50 each. Expressage paid by recipient in either case.

**No. 90.—"Gem" Magic Lantern.**—The Gem is a new style of Magic Lantern, designed especially for the amusement and instruction of the young; and intended to supersede the imported "Toy" Magic Lanterns, over which it possesses the following advantages: The *Body* of the Gem Magic Lantern is convenient in form—is substantially made of strong tin, neatly japanned, and will last for years. The *Lenses* are of excellent quality, accurately ground and polished, and define the views clearly upon the screen. The *Light* is obtained by the use of an

improved candle in a patented carrier, which keeps the flame constantly in the central line of the lenses, and yields a good illumination. As there is no oil or fluid of any kind, cleanliness is the result, and a child can safely operate the Gem Magic Lantern without difficulty. The *Magnifying Power* is abundant, and the Views can be distinctly enlarged to three feet in diameter, or

larger. The *Slides* are neatly finished, and highly colored. Made by THOS. H. McALLISTER, Manufacturing Optician, 49 Nassau St., New York. We also include with Lantern twelve Gem Magic Lantern Slides, with pleasing views. 9 subscriptions, at \$1.50 each, will secure this premium. [Or we will supply one, with the 12 slides, on receipt of \$7.50.] Expressage in either case to be paid by receiver.

**No. 91.—The "Æolia" Piano.**—This is a pretty Toy Piano, it has 15 Keys, is 16 inches long, 10

wide and 4½ high; its tones are very pleasing and is just the thing for the little girls. Two subscriptions at \$1.50 each, will secure this [or we will supply it for \$1.00]. Receiver to pay expressage.

**No. 92.—Fifteen String Zithern.**—A musical instrument which may be new to many of our readers. It can be played by notes or figures, and tuned like a harp. A sheet containing tunes and instructions how to play, accompanies each instrument; it is packed in a box. From E. G. SELCHOW & Co., 41 John St., N. Y. Price, \$1.25. Two subscriptions at \$1.50 each, will secure this, post-paid [or we will send it, post-paid, for \$1.25.]

**No. 93.—Metalaphone.**—This is a Musical Instrument of pleasant sweet tone, in ornamented frame, with 22 Notes (3 Octaves), made of Metal, nickel-plated and engraved, and is played by striking the notes with two small mallets, seen in the engraving. From STERN & LYON, 20 Park Place, N. Y. Two subscriptions at \$1.50 each, will secure this [or we will supply it for \$1.50]. Expressage to be paid by recipient in either case.

**No. 94.—Cornet.**—This has 12 Keys, is made of Brass, with Porcelain Mouthpiece. Length, 13½ inches. From same firm as No. 93. Two subscriptions at \$1.50 each, will secure this. [Or we will supply it for \$1.25, post-paid.]

**No. 95.—Drum.**—Made of bent-Ash, Sheep-skin heads, size across heads 14 inches, varnished and

ornamented, and sticks. It is a very good drum. From same firm as No. 93. Two subscriptions, at \$1.50 each, will secure this [or we will supply it for \$1.25], the expressage to be paid by the recipient in either case.

**No. 96.—German Harmonica.**—Made of black wood, polished, nickel plated. Forty-eight notes

and tremolo. A desirable instrument. From same firm as No. 93. Two subscriptions at \$1.50 each will secure this post-paid [or we will supply it for \$1.25 post-paid.]

**No. 97.—Music Roll.**—This is made of imitation "Russia" Leather, and ornamented in gilt. Leather handle, gilt lettered. Length 14½ inches. From same party as No. 67. Two subscriptions at \$1.50 each, will secure this [or we will supply it for \$1.50.] sent by mail, post-paid, in either case.

**No. 98.—Excellent \$15 Overcoat.**

**No. 99.—Excellent \$20 Business Suit.**

**No. 100.—Excellent \$30 Dress Suit.**

MADE TO ORDER AND WELL MADE.—Here are articles wanted by tens of Thousands. The extensive establishment of JESSUP & Co., 254, 256 Broadway, has long been very widely and favorably known. (Many of the suits now in use by the leading men in the *Agriculturist* Office, came from this establishment, because they have there obtained good articles at reasonable figures). This establishment sends samples of fabrics, with prices, all over the country, and full directions, with engravings, enabling any one to furnish all the measurements needed to make up garments, guaranteed to fit. We have made arrangements with Messrs. Jessup & Co., by which we can furnish these good premiums, viz.: **No. 98.**—A Good \$15.00 Winter Overcoat, will be presented to any one sending only sixteen subscribers at \$1.50 each. **No. 99.**—A good \$20.00 Business Suit, for only twenty subscribers at \$1.50 each. **No. 100.**—A Good \$30.00 Dress Suit (Broadcloth or Diagonal), good enough for a wedding or any occasion, for only thirty subscriptions at \$1.50 each. The Garments will be forwarded anywhere by express or otherwise, as desired. Expressage to be paid by receiver. N. B. To those desiring, or entitled to the above garments as premiums, we will mail samples of fabrics to select from, with directions for self-measurement, etc., and the garments will be cut and well made up in the style desired. Here is an opportunity for many to get good clothes with no expense, except the carriage. A few persons may unite and make up a club of subscribers, and secure a fine suit as a present to a Clergyman, or to any worthy person.

**No. 101.—Family Scales.**—These scales, combining the advantages of counter and platform scales, are peculiarly adapted to household purposes. (See Engraving.) They weigh from ½ ounce up to 240 lbs. They have a scoop, or pan, for weighing flour, sugar, or other house stores, and a platform for heavier articles, and are just such an apparatus as is needed for in-door or out-door use, occupying less than 2 feet square. These scales are manufactured by the well-known FAIRBANKS & Co., No. 311 Broadway, New York, whose weighing apparatus has long ranked as the standard in all parts of the country. Send to them for circulars, if desired. Only 15 subscribers, at \$1.50 each, will secure these fine Scales.—[We will also supply these scales on receipt of the price, \$14.00.] Receiver to pay the freight.

Premium 101

### No. 102.—Whitman's Fountain Pump.

—The Fountain Pump is made of brass, handsomely finished, with Sprinkler and Rubber Hose attached. It is durable, and just as represented, and does not rust or dry up. It is novel, the mechanism simple, is useful at all seasons of the year, and particularly valuable as an always ready practical Fire Extinguisher. (See engraving.) New improvements have been made, and the price with Sprinkler and Hose complete reduced from \$10.00 to \$8.50. Many thousand dollars worth of property have been saved from fire with the help of the Fountain Pump, and Trees, Vines, etc., innumerable, from Insects and Dronth. It is easily carried, (weighing less than four pounds), and can be used by even a child. Manufactured by JOSIAH A. WHITMAN, No. 128 North Main St., Providence, R. I. Only 11 subscriptions at \$1.50 each are needed to obtain this Pump. [Or we will supply one for \$8.50.] The Carriage to be paid by receiver.

### No. 103.—W. S. Blunt's "Universal Force Pump."

—[Patented July 28, 1876.]—See Engraving.—What most country families need. An indoor Force Pump for 1½ inch Suction Pipe; capacity 15 to 18 gallons per minute. These pumps are tested to 150 pounds pressure, and will throw water from a hose pipe 50 feet high, and 90 feet horizontally, and have revolving tops, so that they can be made right or left hand. Being operated by a side shaft entering through the air-chamber, there is no piston rod to wear out the brass stuffing box as in other pumps. They are among the most powerful, simple, and durable pumps to be had. The ease with which any part can be renewed in case of accident, or access had to the interior for repairs, commends them for green-houses, farmers, and stockmen, as well as for city use. Send for a descriptive circular to THE NASON MANUFACTURING CO., 71 Beekman St., and 71 Fulton St., New York. We will present you this Pump, for your own use, (or for sale at \$12.) if you simply procure us 14 subscribers, at \$1.50 each, which you can readily collect during a very few evenings or on rainy days. It will well repay the effort.—[We will supply this pump on receipt of the price, \$12.00.] Receiver to pay expressage.

Premium 103  
UNIVERSAL FORCE PUMP.

shown in the engravings. Can be converted into an Injector, or an Insect or Bug Exterminator at short notice. It is made of Brass, with three feet of Hose, and will throw a good sized stream of water. From P. C. LEWIS, Catskill, N. Y. Seven subscriptions at \$1.50 each, secures this [or we will supply it for \$5.] Receiver to pay expressage.

### No. 104.—Lewis' Combination Force Pump.

—This combination makes three machines, as shown in the engravings. Can be converted into an Injector, or an Insect or Bug Exterminator at short notice. It is made of Brass, with three feet of Hose, and will throw a good sized stream of water. From P. C. LEWIS, Catskill, N. Y. Seven subscriptions at \$1.50 each, secures this [or we will supply it for \$5.] Receiver to pay expressage.

### No. 105.—Umbrella Stand.

—Made of Malleable Iron and Bronzed; height 30 inches. From the MERIDEN MALLEABLE IRON CO., 43 Park Place, N. Y. Four subscriptions at \$1.50 each will secure this [or we will supply it for \$2.50.] Receiver to pay expressage.

No. 106.—U. S. Flag.—Made of Delaine or Bunting, extra canvass heading. Length 8 feet. From DETWILLER & STREET, 13 Dey St., N. Y. Thirteen subscriptions at \$1.50 each, will secure this [or we supply it for \$11.00.] Receiver to pay expressage in either case.

### No. 107.—German Student Lamp.

This lamp is known the world over for its beauty and steadiness of light, its superiority in economy, safety, etc. C. F. A. HINRICHS, of 31 Park Place, New York, has made many valuable improvements in their construction. He is the Patentee of the "Saint Germain, or German Study or Office Lamp," made by C. A. Keelmann. This lamp includes the various latest improvements, such as the Enlarged Fount, slant off at the bottom (a great security against accidents in filling), Improved Chimney-Holder, etc. (None genuine without the name of C. F. A. Hinrichs on the Chimney-Holder). We use these lamps in all rooms in the house (kitchen included), and would exchange them for no other method of lighting yet known to us. The price of the St. Germain German Study Lamp is now reduced to \$5 for the large size (No. 1), in polished brass, including shade, chimney, and wick, complete, ready for use. We will present one of them to any one sending Seven subscribers at \$1.50 each. The same Lamp in nickel-plating is sold at \$6.00. We will present the Nickel-Plated Lamp for Eight subscribers at \$1.50 each. Freight or expressage paid by recipient. (25 cents extra, if to be boxed for sending to a distance.)

The price of the St. Germain German Study Lamp is now reduced to \$5 for the large size (No. 1), in polished brass, including shade, chimney, and wick, complete, ready for use. We will present the Nickel-Plated Lamp for Eight subscribers at \$1.50 each. Freight or expressage paid by recipient. (25 cents extra, if to be boxed for sending to a distance.)

NO SAGGING OR ROLLING TO THE CENTER ON THIS BED.

### No. 108.—The National Wire Mattress.

—Everybody wants a good Bed. One who sleeps well, will do more and better work of body and mind, and enjoy better health, and live longer. This premium will help to sleeping comfortably. It is manufactured by the NATIONAL WIRE MATTRESS CO., New Britain, Conn. As shown by the engraving, the Mattress is made on what the manufacturers claim a mechanical principle; that it never can sag; that it will never rust in any climate; that it can be taken apart and folded into small space, and that it is the only one getting its elasticity from wire-tempered Springs. Those who have used these Mattresses, (including our Editors,) pronounce them in every way desirable. To any one sending us 12 subscriptions, at \$1.50 each, we will present one [or supply one for \$10.50.] Receiver to pay freight. (Send inside bedstead measure.)

### No. 109.—Box of Mathematical Instruments.

—Just the thing for a youth who has a taste for drawing. These Instruments are put up in a neat Mahogany Case, which contains: Two Dividers, one Pen Point, one Pencil Holder, one Extension Bar, one Ruling Pen, one Crayon Holder, one Brass Protractor, one Small Scale, two Wooden Triangles, one Cake India Ink, four Cakes Water Colors, Cups and Brush. From same firm as No. 65. We will present this Box of Instruments for 4 subscriptions at \$1.50 each. [We will supply one of these for \$3.00.]

If to go by mail, send us 15 cents for postage & packing.

### No. 110.—Pair of Vases.

—These are made of Spelter, with iron base, colored black and green, imitation Bronze. From same firm as No. 105. Three subscriptions at \$1.50 each will secure these [or we will supply them for \$2.00.] Receiver to pay expressage.—These are very pretty Vases for the price, and are quite ornamental. Height 11 inches—Diameter of Vase 3½ inches.

### No. 111.—Victor Combination Linen Marker.

—Each box contains a Marker, Type Rack, and complete font of Type, with Tweezers for picking up the type, Ink Pad, and a bottle of superior Indelible Ink. The marking for an entire family may be done with the same instrument, the type being movable. From THE ACME MANUFACTURING CO., 31 Park Row, N. Y. Price, \$1.00. Two subscriptions, at \$1.50 each, will secure this, delivery paid by us. [Or we will deliver it for \$1.00.]

### No. 112.—Gentleman's Pocket-book.

—Of handsome English calf, extra quality, with 7 Pockets and Strap; also a Bill-fold. From same firm as No. 65. Presented for 4 subscribers at \$1.50 each, and 10 cents for postage [or we will supply it, post-paid, for \$2.50.]

### No. 113.—Lady's Pocket Book.

—This is made of American "Russia" Leather, nickel plated mountings and clasps, pockets for silver and bills, with memorandum tablet, silk handle and tassels. From WILLY WALLACH, 36 Park Row, N. Y. Two subscriptions at \$1.50 each will secure this post-paid [or we will supply it for \$1.00 post-paid.]—A very convenient article.

### No. 114.—Bird Cage of Bright Brass Wire.

—Height, 18 inches; diameter, 9 inches; base, 12½ inches, with patent Cups and metal-tipped Perches. From the WILLIAMS GLOBE WIRE WORKS, 85 Fulton St., New York. We will present this for 5 subscribers at \$1.50 each, [or we will supply it for \$4.] Expressage to be paid by the recipient.

### No. 115.—Sewing Bird and Spring Tape Measure.

—The Sewing Bird is plated, with

post-paid [or we will supply them post-paid for \$1.30].

### Bad and Good Silver-Plated Ware.

In no other business we can think of, is there so great an opportunity for *fraud* as in silver-plated ware. The electric battery will spread 25cents of silver over a whole tea set, or over a hundred spoons, made of cheap pewter, so that nothing but pure silver can be *seen*; and a great deal of plated ware little better than this is made and sold. The deception is not discovered until it is put to wear. But the electric process continued long enough will coat an article with silver so thickly that it will, if on a good base, be equal to solid silver for service and good looks during many years, while costing far less; and when by long use the silver wears off in spots, or over the whole, it is easy to renew the coat at small expense. The inexperienced purchaser must depend wholly upon the *honesty* of the manufacturer.—Another point is to put the plating upon *white* metal (not lead or common pewter) so that it will not show even if long, hard usage wears off a point or corner. In selecting the following Premium Articles we have taken special care to get *only the very best in all respects*, those which we can recommend and warrant.—Our readers who get any of these, as Premiums (or by purchase), may rely upon having *first-rate* articles, and as *cheap* as they can be *honestly* made. They can find plenty of similar articles, at less than a fourth the prices named, and that will look as well for a few weeks, or months, if not used, but they will be *very dear*. We do not compete with the silver-plated articles frequently offered at *apparently* low rates. The Premiums 116 to 141 (excepting 138-9 & 140) are made for us by the MIDDLETOWN PLATE COMPANY, at Middletown, Ct. Mr. JUND is well acquainted with this Company and its Officers, and has visited the extensive works frequently, observing the process of manufacture, and he confidently recommends their work as being *just what it professes to be*—and every way reliable. A similar commendation applies to Premiums 138, 139, and 140 from the MERIDEN CUTLERY CO., whose work is first-rate.

#### No. 116.—Flower Vase.

—A most beautiful Peacock Pattern, elegantly chased, heavily triple-plated in silver without, and gold within so that it will not tarnish by contact with plants in water. Height, nine inches. We selected this as the most pleasing among a large assortment, from different makers. This and No. 117 are supplied to us by the MIDDLETOWN PLATE CO. We present it for 8 subscriptions at \$1.50 each, [or, we will supply it for \$6.] Expressage to be paid by recipient.

#### No. 117.—Card Receiver.

—Elegantly chased, Deer Pattern. The Receiver is a large dishing silver-leaf, nine inches long, five inches wide. We selected it from many forms as the most beautiful for the price (\$6). We will present

it for *Eight* subscriptions at \$1.50 each, [or supply it for the price, \$6.00.] Receiver to pay the expressage.

**No. 118.—Sugar Tongs.**—Beautiful, Crown Pattern, Extra Plate. Price, \$2.12. Presented post-paid for 3 subscribers at \$1.50 each. [Or, sent post-paid for \$2.12].

Premium 119

#### No. 119.—Ice (or Water) Pitcher.

—A large, highly Ornamental Article, that will adorn the table, as well as serve a very *useful* purpose, and last many years, with no danger of breakage. Price \$13. Triple-plate on white metal, from MIDDLETOWN PLATE CO., will be presented for 14 subscribers, at \$1.50 each, this year, will secure the splendid Pitcher.—Only 18 subscribers, at \$1.50 each, will secure the **Pitcher** with a **round Salver**, of pattern to correspond, (value \$17.50).—For only 28 subscribers we will send the **Pitcher** and a large 14-inch **Oblong Salver** (value \$28.00), which is large enough to hold the Pitcher and two goblets.—For only 35 subscribers, at \$1.50 each, we send **Pitcher**, **Oblong Salver**, and a *pair* of beautiful **Goblets**, silver without, and *gold-plated* inside, (value \$34.75). This *Complete Set* is exceedingly desirable, though the Pitcher alone, or that with Round Tray, or with large Oblong Salver, will answer well for *use* and for *ornament*.—[We will also supply the Pitcher, and any one or all the articles above mentioned, at the prices given for each.] Receiver to pay expressage.

#### No. 120.—Fruit Knife and Nut-Pick,

combined in one handle, both opening to spring back. Blade finely chased. Handle, Crown Pattern. Heavily Plated. This is a fine

#### Nos. 121, 122—Cake Baskets.

—Two styles offered, both of *elegant* patterns, very taking, *useful*, and *beautiful* table ornaments—just the thing everyone wants. From same makers and same metal as No. 116. No. 121 presented to any one sending *Ten* subscribers, and No. 122 to any one sending 12 subscribers, at \$1.50 each.—[Or we supply No. 121 for \$7.50, or No. 122 for \$10.] Receiver to pay expressage.

#### Nos. 123 to 125. Casters.

—These are all of *handsome* patterns, richly chased, No. 123 containing *five* cut glass bottles, including mustard, & (the two others *six*, including a Mustard bottle)—*useful*, necessary, ornamental for every dining table. Same makers, and same metal and plating, as No. 116. Send us

*Seven* subscribers, at \$1.50 each, and get No. 123, or *Ten* subscribers and get No. 124, or 12 subscribers for No. 125.—[Or we will supply No. 123 for \$5.25. No. 124 for \$7.50, or No. 125 for \$10.50.] Receiver to pay expressage.

Premium 125

#### No. 126.—Pickle Jar and Fork.

The jar is of glass, handsomely mounted in silver-plated frame, with fork attached. It is a very ornamental article for the table, as well as useful, and would prove an acceptable present to a young house-keeper, or, indeed, equally so to the wife, in any home. For 7 subscriptions at \$1.50 each we will present it. [Or will forward one on receipt of \$5.] Receiver to pay expressage.

Prem. 126

#### No. 127.—Syrup Cup with Plate.

—Every well set table needs at times a syrup cup. This elegant cup stands on a fine plate of suitable design. Only *Eight* subscribers at \$1.50 each, will now secure it *free*. [Or, when desired, we will send one on receipt of the price, \$6.25.] Receiver to pay expressage.

Premium 127

Premium 128

#### No. 128.—Child's Cup.

—(See Engraving.)—A beautiful gift for the *Little One*. Triple-plated on the outside, and *gilded* on the inside. It never breaks, and will last for many years—indeed, be a *life-keepsake*. Obtain *five* subscribers, at \$1.50 each, and you can secure one of these beautiful cups for your own Child, or a name-sake, or other favorite.—[Or we will forward one on receipt of price, \$3.50.] Receiver to pay expressage.

#### No. 129.—One Pair Salt Cellars.

—These are engraved glass, with heavily plated Stands, and will be found both useful and ornamental. Furnished by the same Company as No. 116. *Eight* subscriptions at \$1.50 each will secure these [or we will supply the pair for \$5.50, post-paid]. If desired, we will furnish one for half the number of subscribers.

**No. 130.—Butter Knife.**—Beautiful form, Crown Pattern. Price, \$1.25, and worth it, as it is heavily Triple-Plated on white metal, and made for long service. We could supply as good-looking knives, called "extra

plate," for 50 to 75 cents, but this is worth a dozen of them, and we prefer it at the extra price. (This remark applies to all the articles here offered). We send this post-paid, for two subscribers at \$1.50 each, [or, for \$1.25].

**No. 131.—Butter Dish.**—This is a very pretty pattern; it is chased and ornamented, with Rests for butter knife, and is a good and useful article, and one easily obtained. Furnished by the same Company as No. 116. Six subscriptions at \$1.50 each will secure this [or we will supply it for \$4.25]. Receiver to pay expressage.

**No. 132.—Individual Pepper and Salt Caster.**—This is a very neat and useful article; it is gilt-lined, and heavily plated. Furnished by the same Company as No. 116. Five subscriptions at \$1.50 each will secure this [or we will supply it for \$3.50, post-paid].

**No. 133.—Napkin Ring.**—On a Base; Dove pattern; a very fine one for the price, \$1. Triple plated. Presented post-paid for two subscriptions at \$1.50 each.

**No. 134.—Napkin Ring.**—A new pattern, of latest style. The form is shown in the engraving. Heavily plated.—We will present this, post-paid, to any actual subscriber who will procure and forward one new subscriber at \$1.50, [or we will send it post-paid for 75 cents.] Both of these fine Napkin Rings are supplied to us by the MIDDLETOWN PLATE CO.

**No. 135.—Spoon Holder.**—This is chased and gold-lined; it is heavily plated, and will be found always useful. Furnished by the same Company as No. 116. Seven subscriptions at \$1.50 each will secure this [or we will supply it for \$5.00, post-paid].

**No. 136.—Sugar Shell - Mustard Spoon-Salt Spoon.**—All beautiful; Crown Pattern, Double-Plated. All Three presented for three subscribers at \$1.50 each, and sent post-paid. [Or, will he sent post-paid for \$2.00]. This, as well as the Premiums above, is supplied by the MIDDLETOWN (Ct.) PLATE CO.

**No. 137.—Watch Stand.**—A pretty present for a lady; it is heavily plated, velvet-lined, and finely finished. Furnished by the same Company as No. 116. Seven subscriptions at \$1.50 each will secure this [or we will supply it for \$5.00, post-paid].

**No. 138.—One Dozen Tea-Spoons.**  
**No. 139.—One Dozen Table-Spoons.**—These are all of the elegant Crown pattern, fine metal, triple plated, and for beauty of design, and excellence of workmanship, will be found unsurpassed by solid silver. These spoons are far cheaper than many others we have found at quarter the price, and well worth canvassing for.

Style of Prem. 138, 139, and 140

They are made by the MERIDEN CUTLERY CO., No. 49 Chambers St., N. Y. City. Nine subscribers sent us at \$1.50 each will secure 12 Tea Spoons (worth \$7.25); sixteen subscribers, at \$1.50 each, will secure 12 Table Spoons (value \$14.50) [We will supply the Tea Spoons for \$7.25 per dozen, and the Table Spoons for \$14.50; or a set of six for half these prices.] Receiver to pay expressage. [Or] We will supply a set of half a

dozen Tea-spoons for 5 subscribers, or a set of half a dozen Table-spoons for 9 subscribers, at \$1.50 each.

**No. 140.—One Dozen Table-Forks.**—The same description and remarks apply to these as to No. 139, and they are from the same makers. (We select as Premiums only such articles as we can warrant in quality and price, and these the most desirable.) Price \$14.50. Presented free to any one sending only 16 subscribers at \$1.50 each, or a set of six for 9 subscribers. [We will supply one dozen for \$14.50, or a set of six for \$7.25.] Receiver to pay expressage, if not delivered at this office.

**No. 141.—Child's Set: Knife, Fork, and Spoon.**—This is Standard Silver Plated, white metal base, medallion pattern, in satin-lined morocco

case; an elegant present. Supplied by the MERIDEN CUTLERY CO. Four subscriptions at \$1.50 each will secure it free. [Or we will send a set on receipt of the regular price, \$3.00.]

[Or] If to go by mail, send us 15 cents for postage & packing

**No. 142.—Nut Picks and Cracker.**—One-half dozen Nut Picks and a Nut Cracker, put up in a

handsome case. These articles are unique in appearance, and substantial in material and construction, being made of steel throughout, chased with handsome designs, and heavily nickel-plated. By same manufacturer as No. 49. For three subscriptions, at \$1.50 each, we will present this set and case. [Or we will supply them for \$2.25.] [Or] If to go by mail, send us 15 cents for postage & packing.

**No. 143.—Cutting Nippers.**—Hall's Patent Double Compound Lever, giving great cutting power with use of little strength of hand. Length, 7 inches. Jaws open to cut wire  $\frac{5}{32}$  inch diameter. Made of the finest quality of steel, by the Interchangeable Tool Company. Furnished to us by JOSEPH T. FARRINGTON, 32 Howard St., N. Y. These Nippers are just the thing for cutting Fence Wire, and useful also in cutting wires for many other purposes; very handy in any Tool Chest. Three subscriptions at \$1.50 each, will secure these, post-paid. [Or we will mail them, p.p., for \$2.1

Premium 144

**No. 144.—"Granite" Tea Set.**—Tea Pot—a Sugar Bowl, Cream Pitcher, Slop Bowl and Spoon Holder. They are perfectly fire-proof, being made of Sheet Iron, coated with the Perfection Granite Coating, giving them a mottled finish, which is very pleasing and attractive. They are finished in Nickel-plate mountings and Fire Proof Bands, and the style represented in the engraving is the one we offer. These are furnished by MANNING, BOWMAN & Co., 57 Beekman St., N. Y. *Nineteen* subscriptions at \$1.50 each will secure this entire set [or we will supply it for \$15.50]. Receiver to pay expressage.

**No. 145.—Coffee Pot.**—This is made of the same material as No. 144. It is Fire Proof, and will hold 5 pints; it is finished in Nickel plate with Fire Proof Bands. The engraving is a good representation of this Premium. From same firm as No. 144. *Four* subscriptions at \$1.50 each, will secure this [or we will supply it for \$3.00]. Receiver to pay expressage.

**No. 146.—Seamless Water Pitcher.**—This is made of the same material as No. 144. It is finished in Nickel plate mountings with Protection Bands. For the style of this Premium see engraving. From same firm as No. 144. *Eight* subscriptions at \$1.50 each will secure this [or we will supply it for \$6]. Receiver to pay expressage.

**No. 147.—Butter Dish.**—This is made of the same material and finish as No. 144. It has Nickel-plated Mountings and Protection Bands. From same firm as No. 144. *Six* subscriptions at \$1.50 each, will secure this [or we will supply it for \$4.00]. Receiver to pay expressage.

**No. 148.—The American Plaiter.**—Made of Black Walnut, 18 inches long, 8 inches wide, brass strips along the sides, rubber tension, and 72 needles.

Will do almost any kind of plaiting. From same firm as No. 156. *Two* subscriptions at \$1.50 each will secure this post-paid [or we will supply one for \$1.50, post-paid.]

**No. 149.—China Tea Set.**—This is French China, white, with gold band decoration, and consists of 56 Pieces, viz.: Tea Pot, Sugar Bowl, Cream Cup, Slop Bowl, Tea Plates, Sauce Plates, Cups and Sangers, Bread and Cake Plates, all securely packed and boxed for shipment. From JAMES M. SHAW & Co., 25 Duane St., N. Y. *Seventeen* subscriptions at \$1.50 each secure this [or we supply it for \$13.00.] Receiver pays expressage.

**No. 150.—Work-Box.**—This is made of finely polished wood, cover inlaid, lined with velvet; contains Scissors, Needle Case, Piercer, Bodkin, Thimble, and has a Mirror in the cover; has Lock and Key. Size, 9½x6½ inches. From same firm as No. 58. *Five* subscriptions at \$1.50 each, will secure this [or we will supply it for \$3.50]. Expressage paid by recipient.

**No. 151.—Aquarium.**—Many homes can be made more cheerful and entertaining by the introduction of little things to please the eye and at the same time afford instruction to the young. All over the country there are those who have abundance of flowers and other ornaments, and who would gladly add representatives of animal life, if they knew where they could get the proper conveniences for keeping the same at a moderate cost.

To meet this want, we have made arrangements with Messrs. STEPHEN FREEMAN & SON, of Racine, Wisconsin, to offer as one of our Premiums an Aquarium as shown in the cut. This one is designed for a shelf or table, and holds 5½ gallons of water—large enough for keeping quite a large number of fish and other marine animals and plants. Presented for 10 subscriptions at \$1.50 each [or we will supply it for \$8]. Freight or express paid by receiver.

**No. 152.—Embroidery Frame.**—(With the Embroidery Frame is also suitable canvas and 3 Design Books.) It is made of cherry wood, highly polished. The Frame is in size, 9x10 inches. The Canvas on which the embroidery is to be done, is first fastened to the frame, as seen in the cut, and then, by turning the screws of the Frame, the Canvas is made tight, so that designs can be worked most beautifully, and with great ease and rapidity. Sent *free* and post-paid for 2 subscribers at \$1.50 each; [or we will supply it post-paid for \$1.10.]

**No. 153.—Extension Step Ladder.**—This is made of Pine, 3 feet high, when closed, and 6 ft. when extended. From same firm as No. 156. *Five* subscriptions, at \$1.50 each, will secure this [or we will supply it for \$3.25.] Receiver to pay expressage.—A very handy article for use about the house; for picking fruit, and many other purposes; can be set aside in small space when not in use.

**No. 154.—Metallic Hair Brush.**—Made of Rubber, with Ornamented Back, the Bristles are Metallic Wire. From same firm as No. 58. *Two* subscriptions at \$1.50 each, or \$1.25 cash, will secure this, post-paid.

**No. 155.—Celluloid Brush and Comb.**—These are made of white Celluloid, Brush of white bristles; light, strong, and durable; very handsome; hardly distinguishable from pure white ivory. Price, \$4.75. Only *Six* subscriptions, at \$1.50 each, secure these. [Or we will supply them on receipt of \$4.75.] If to go by Mail, sent us 10 cents for postage & packing.

these. [Or we will supply them on receipt of \$4.75.] If to go by Mail, sent us 10 cents for postage & packing.

**No. 156.—Set of Folding Table Mats.**—Made of alternate strips of light and dark wood, oval-shaped and polished, (six in set.) From J. H. BALDWIN & Co., 21 Murray St., N. Y. *Two* subscriptions at \$1.50 each, will secure these [or we will supply them for \$1 p-paid.]

**No. 157.—Shawl-Strap.**—This has three straps, made of leather, with nickel-plated mountings. From SPELLMAN BROS., 355 and 357 Broadway, N. Y. Price, \$1.10. *Two* subscriptions at \$1.50 each, will secure this post-paid [or, we will supply and send it post-paid for \$1.10].

**No. 158.—Crumb Tray and Brush.**—

The Tray is hand-somely painted, and ornamented, and the Brush matches the Tray. From same firm as No. 156. *Two* subscriptions at \$1.50 each will secure these [or we will supply them for \$1.00] post-paid.

**No. 159.—Ice Cream Freezer.**—This is a Packard's Standard Freezer; capacity 4 quarts. Can of the best quality, heavily coated with tin plate; has iron bottom of a new pattern; tubs of white cedar, with galvanized hoops. The cover of tub, containing gear wheels, is made of hard-wood, and the fittings are of malleable iron. Very convenient for home-made Ice Cream. From same firm as No. 156. *Eight* subscriptions at \$1.50 each will secure this [or we will supply it for \$5.50.] Receiver to pay expressage.

**No. 160.—Blacking Case.**—Made of Black Walnut, finely finished; top carpeted, having a drawer for brushes, blacking, etc. A great convenience as compared with having blacking and brushes lying around anywhere and everywhere, and no place to use them. From same firm as No. 156. *Four* subscriptions at \$1.50 each will secure this [or we will supply it for \$3.00.] Receiver to pay expressage.

**No. 161.—Lady's Folding Lap Board.**—Constructed of alternate strips of Black Walnut and Pine, securely fastened to cloth, making it flexible; can be folded up. Nicely finished, and has a yard measure stamped upon it. From same firm as No. 156. *Two* subscriptions at \$1.50 each will secure this post-paid [or we will supply one for \$1.50, post-paid.] Lower cut shows it rolled up.

**No. 162.—The Travers' Patent Hammock.**—This is made of strong Twine, Brass Mounted, Cardinal Binding, and is very durable. From J. P. TRAVERS & SON, 46 Beckman St., N. Y. Price, \$3.00. We will present this for four subscriptions at \$1.50 each. [Or we will supply it for \$3.00]. Receiver to pay carriage. If to go by mail, send us 40 cents for postage & packing.

**No. 163.—Hammock.**—Made of colored twines; strong, durable, and useful. From same firm as No. 162. We will present this for 2 subscriptions at \$1.50 each. [Or we will supply it on receipt of \$1.50.] If to go by mail, send us 24 cents for postage & packing.

**No. 164.—Choice Small Fruit Plants,** to wit: **Strawberries, Raspberries, Blackberries, Grapes, Currants, and Gooseberries.**—For 2 subscribers at \$1.50 each, we will send

Plants to the amount of \$1.00, as described below.

For 4 subscribers at \$1.50 each, we will send Plants to the amount of \$2.00.

For 6 subscribers at \$1.50 each, we will send Plants to the amount of \$3.00.

Any one desiring the above Plants, as a premium, can send a Postal to J. T. LOVETT, Little Silver P. O., Monmouth Co., N. J., for his Catalogue (which will be sent free of charge), containing accurate descriptions and prices of the different varieties, full instructions for preparing the soil and planting, and much other valuable information. These plants will be sent, by mail, post-paid. We will also supply any of the plants named, at the prices and terms given in the Catalogue. (These Premiums are for the plants selected at the catalogue rates by the dozen, and not by hundred or thousand rates.)

**No. 165.—Choice Garden, Flower, and Agricultural Seeds.**—We have made an arrangement with Messrs. D. M. FERRY & Co., Detroit, Michigan, which enables us to furnish as premiums, Seeds in almost endless variety, and they will be sent post-paid anywhere in the United States or British America, and to any other part of the world on receipt of two cents per packet extra, for extra postage. This firm, established in 1836, stands in the front rank of seed-growers in the United States and in the world. They exercise the utmost care in growing and preparing their seeds for market; hence their seeds seldom fail. Those who desire seed Premiums can rely on having the very freshest and best grown in every instance. The seeds are put up in packets, with full directions how and when to plant, and on the packet is a lithograph in colors of the flower or fruit the seeds contained therein will produce. Our lady friends will certainly appreciate this opportunity to obtain choice flower and garden seeds of different varieties. Persons can send their subscriptions and then secure

their premiums at any time, by an order from us, which will be faithfully honored by D. M. Ferry & Co., any time before July 1st, 1881. All entitled to one of these Premiums, can send a Postal to D. M. Ferry & Co., and receive free their large and beautiful 150-page Illustrated Catalogue, containing a full description and price-list of Garden, Flower, and Agricultural Seeds of every variety, and from this select any seeds desired. Any subscriber sending one new subscription at \$1.50, may select seeds amounting to 75 cts., at price in D. M. Ferry & Co.'s catalogue. For two subscriptions at \$1.50 each, we will present seeds to the amount of \$1.50. For any three subscriptions at \$1.50 each, we will present seeds as above, to the amount of \$2.25. For four subscriptions at \$1.50 each, we will present seeds as above, to the amount of \$3. For five subscriptions at \$1.50 each, we will present seeds as above, to the amount of \$4, and we will add \$1 worth of seeds for each additional subscription (above 5), in one club, at \$1.50 each—all seeds sent post-paid, as first stated above, when desired. We will also supply any of the seeds named at catalogue prices, and send them post-paid. [These premiums are for seeds in packets only, and not for seeds sold by weight or measure.]

**Nos. 166 to 168.—Beautiful Flower Bulbs,** delivered free at your post office. These three Premiums are put up for us by Messrs. B. K. BLISS & SONS, 34 Barclay St., New York, whose Horticultural establishment and whose reputation are among the very best in the country, and too well known to need special mention by us here. The bulbs in each assortment are selected by them, and our friends can rely upon getting them as represented. For two subscribers at \$1.50 each, we will send post-paid, Premium No. 166, which comprises bulbs as follows: 3 Hyacinths; 12 Tulips; 12 Crocuses; 6 Narcissuses [or, we will send the package, post-paid, for \$1.00].

For four subscribers at \$1.50 each, we will send post-paid, Premium No. 167, comprising 6 Hyacinths; 20 Tulips, double and single; 25 Crocuses; 12 Narcissuses; 3 Lilies, distinct varieties; 12 Snowdrops [or, we will send the package, post-paid, for \$3.00].

For seven subscribers at \$1.50 each, we will send, post-paid, Premium No. 168, comprising 12 Hyacinths; 25 Tulips; 50 Crocuses; 2 Polyanthus Narcissuses; 6 Double Narcissuses; 6 Lilies, distinct varieties; 6 Jonquils [or, we send the package, post-paid, for \$5.00]. All the bulbs are assorted, and of very desirable varieties.

**No. 169.—Forest Trees by Mail.**—During the past five or ten years, there has been a commendable desire in those districts destitute of forest trees to provide for future wants, by planting each season some seeds or small trees of the most desirable kinds. In order to encourage such an enterprise in every section of the country destitute of timber, we have arranged with Messrs. ROBT. DOUGLAS & SONS, of Waukegan, Ill. (who have been engaged for more than thirty years in planting and raising forest trees), to offer the following parcels of trees,

that can be transported by mail, as premiums to subscribers to the *American Agriculturist*. We will forward post-paid to any address, any one of the 18 parcels named below, on receipt of two subscriptions at \$1.50 each, or will forward any one of the parcels post-paid for \$1. Parcel, (No. 1.)—100 European Larch, from 8 to 10 inches in height; (No. 2.)—75 ditto, 12 to 18 inches; (No. 3.)—100 White Ash, 10 to 12 inches; (No. 4.)—100 Hardy Catalpa, 10 to 12 inches; (No. 5.)—50 Black Cherry, 12 inches, transplanted; (No. 6.)—100 Scotch Pine, 4 to 6 inches; (No. 7.)—100 Ailanthus, 10 to 12 inches; (No. 8.)—50 Hard Maple; (No. 9.)—50 Hickory Elm (*Ulmus racemosa*), 1 year old. For Hedges and Ornamental Planting. (No. 10.)—50 Red Maple, 10 to 12 inches; (No. 11.)—100 Norway Spruce, 6 to 9 inches; (No. 12.)—50 White Spruce, 6 to 9 inches; (No. 13.)—100 American Arbor Vite 6 inches; (No. 14.)—25 Heavy-wooded Pines, 4 to 6 inches; (No. 15.)—50 Norway Maple, 6 inches, transplanted; (No. 16.)—50 Balsam Fir, 6 inches; (No. 17.)—50 Red Cedar, 6 to 9 inches; (No. 18.)—50 Hemlock Spruce, 6 to 9 inches. These trees will be securely packed, and sent free by mail, at the proper planting season. Messrs. Douglas & Sons have had great success in sending trees by mail.

**No. 170.—Eggert's Elite Combination Ink.**—A neat box, containing a bottle of Ink and three boxes of Powders. The ink is used as ordinary ink, and the powder of the color required is then applied with the powder-puff, which comes with the box, and the writing appears either as gold, silver, or copper. From WILLY WALLACH, 36 Park Row, New York. Presented to any one himself a subscriber who sends one other subscription, at \$1.50.—[Or we will supply it for 75 cents.] If to go by Mail, send us 10 cents for postage & packing.

**No. 171.—Combination Drawing-Slate and Writing Desk.**—Contains six drawing copies, paper and envelopes, ink-bottle, pen-holder, lead pencil, slate pencil, and rubber. From same firm as No. 170. Price, \$1.50. For two subscriptions at \$1.50 each, we will present this [or we will supply it for \$1.50]. Expressage in either case to be paid by receiver.

**No. 172.—Three Premiums in One.**—

1st. Black Slate, covered frame.—2d. *Scholar's Companion*, a Tin Box, containing Pen-Holder, Lead Pencil, Slate Pencil, Rubber, Sponge, and Chalk Crayon.—3d. *Hemp-Knitted School Bag*, strong and durable; length, 14 inches; depth, 11 inches. From same firm as No. 170. One new subscription at \$1.50, if sent by a subscriber himself, will secure all these. [Or we will supply the 3 for 75 cents.] If to go by Mail, send us 18 cents for postage & packing.

**No. 173.—Three Premiums in One.**—1st. *Lloyd's Combination Pen-Holder*. This is a Pen-Holder, with pen and lead pencil, ink-eraser and pen-knife combined.—Price, 20 cents. 2d. *Book Clamp*.—This is a very useful and convenient article for carrying books.—Price, 30 cents. 3d. *Transparent Drawing Slate*.—Six pictures accompany the slate. Price, 15 cents. Furnished by E. G. SELCHOW & Co., 41 John St., N. Y. Price for all, 65 cts. One new subscription at \$1.50, sent by any subscriber, will secure all three of these [or we will supply them for 65 cts.] If to go by mail, send us 15 cents for postage & packing.

**Nos. 174 to 180.—Valuable Rubber Articles.**—One may almost say that India Rubber now contributes more to Human Health, Comfort, and Convenience, than any other single natural product—iron excepted. Any one would be astonished to see the immense variety of articles at the great establishment of the GOODYEAR'S RUBBER MFG CO., and GOODYEAR'S INDIA RUBBER GLOVE MFG CO., Nos. 488, 490, 492 Broadway, New York (established in 1844). (Most of them can also be found at 205 Broadway). From the above great stock we have selected seven most excellent and useful articles, which will be highly appreciated by our readers.

*N. B.—These, similarly named, similar looking, are offered at much lower prices, but they are greatly inferior in quality and wear. Those we selected are the very best, highly flexible, strong, durable, worth many times over the inferior lower price fabrics.*

**No. 174.—Rubber Sack Coat, (Gentlemen's) "ZEPHYR."** The great utility of this need hardly be specified. It is strong, durable, entirely water-proof, and yet weighs only about 1 lb. or 16 to 20 ounces, according to size; can be packed in small space; is sent packed in a rubber pouch or bag, for carrying it in. Made in various lengths and sizes. In ordering, give height, weight, and size around breast under the arms, in inches. From the makers named above. This will be presented to any one sending Nine subscribers at \$1.50 each [or supplied for \$7.50]. Sent post-paid in either case.

**No. 175.—Rubber Cap, with Cape.**—A capital thing in a storm, the cape coming down over the neck and shoulders, to shed rain perfectly. The front-piece acts as a roof over the eyes and face, with a sufficient opening for seeing and breathing freely. Weight only 6 ounces. From same makers as above. It will be presented, post-paid, for sending us two subscribers at \$1.50 each [or we will supply it post-paid for \$1.00.] (Send size of hat you usually wear.)

**No. 176.—Men's Leggings (Rubber).**—Nothing could be better than these for a wet day, wet grass, etc., as they keep the pantaloons dry and comfortable. Entirely water-proof, strong, and durable, and yet weighing only 5 ounces for the medium size. Those ordering, should state whether desired small, medium, or large size. From same makers as above. We present and forward a set post-paid for 3 subscribers at \$1.50 each [or we supply them, post-paid, for \$2]. (With these, the Rubber Sack-Coat and Cap, one will be "storm-proof," if the feet be protected; yet the weight of the whole is only 20 ounces, or less than 2 lbs. Total cost of all these, \$10.50. And the whole will be presented, and all sent post-paid, for 12 subscribers at \$1.50 each [or we will supply them, post-paid, for \$10.50].

**No. 177.—Ladies' Zephyr Waterproof.**

—This is of first-rate quality, and a most desirable article for every woman. It is entirely water-proof, lasting, and yet so light that it can be rolled up and carried in the pocket. (Mailed in a small rubber pouch, that may be used for carrying it in.) They vary from 50 to 62 inches in length. In ordering, give measure from neck to bottom of walking-dress, or the length desired from the neck down. From same makers as above. Price \$6. We will present one for eight subscribers at \$1.50 each, [or supply one for the price, \$6.00], and send post-paid.

**No. 178.—Rubber Camp-Blanket,** or for any other use requiring a water-proof cover, or under blanket. Size, 3½×6 feet (45×72 inches); weight, 2½ pounds (40 ounces). Same makers as above. This will be presented for three subscribers, at \$1.50 each [or supplied for \$1.75]. Sent by express unpaid, or sent by mail post-paid for 25 cents extra (one-half the postage.)

**No. 179.—Rubber Air Pillow.**—This is very handy to carry rolled in small space (weighs only 10 ounces); can be inflated in a moment, furnishing a soft, healthful pillow, with sufficient depression in the middle to make it lie easy. From 488-492 Broadway, as above. It will be presented, post-paid, for three subscribers at \$1.50 each [or we send it post-paid, for \$2.00].

**No. 180.—Novelty Folding Pail (Rubber).**

—This is a most valuable article. The Pail is full size, made of strong enamelled Rubber Cloth, coated on both sides, with top and bottom hoops, supported by jointed side braces, with hinges like carriage-top braces. It is durable, and adapted to all purposes of any large pail, and when not in use it folds down to only an inch or so in thickness, so that it can be carried in small space, under the cushion of a carriage or buggy, out of the way and out of sight, but always ready for instant use. Price \$2.50. We will present one for four subscribers at \$1.50 each. [Or supply one for \$2.50.] It will be sent by express unpaid (or it will be sent post-paid by mail if 42 cents extra be furnished.)

**No. 181.—Arctic Overshoes.**—These are made by L. CANDEE & Co., New Haven, Conn., and are supplied with the Patent Back Strap, which fastens on the side of the foot with a Buckle, thus bringing the openings to the rear, so that when walking in the snow, it cannot force its way inside. They are well made, with lined Cloth Uppers, and Rubber Soles of double thickness, and will be found more convenient and comfortable than the old style Arctic. 6 subscribers at \$1.50 each will secure them [or we will supply them for \$3.50.] If to go by mail, send forty cents to pay postage. Always send size of shoes worn.

**No. 182.—One Pair Skates.**—This style is All Clamp, with polished blades, blued top, steel sole and heel plates, double-acting heel and toe Clamps. From PECK & SNYDER, 124 Nassau St., N. Y. 4 subscribers at \$1.50 each will secure them [or we will supply them for \$2.50.] Receiver to pay expressage. Length 8 to 12 in.

**No. 183.—One Pair Skates.**—This style is the N. Y. Club. From same makers as No. 182. Is blued and made of steel. Size 8 to 11½ inches. 5 subscribers at \$1.50 each will secure these [or we will supply them for \$3.25.] Receiver to pay expressage.

**No. 184.—One Pair Skates.**—This style is the Patent Self-adjusting American Club, and when once adjusted, remain so. They are made of blued steel, foot-plates and Clamps, and polished blades. From same firm as No. 182. Size 8 to 11½ inches. 8 subscribers at \$1.50 each will secure these [or we will supply them for \$5.00.] Receiver to pay expressage.

**No. 185.—Self-Adjusting, gold plate, Watch Key.**—This Key is universally acknowledged by Practical Watchmakers to be the best ever offered to the trade. Several times, while on a summer trip in the country, we were able to accommodate friends, who had lost or mislaid their own watch keys, with one that would fit any watch, and it was one of

these neat little things of Birch's invention. Each Key is thoroughly tested before being sold, and the whole is manufactured under the immediate supervision of the

Patentee. Two subscribers, at \$1.50 each, will secure post-paid, the neat gold plate Key offered as Premium. For three subscribers, we will send free the more expensive style, celluloid, with gold-plated tips, retailed at \$1.50. Made by J. S. BRACH, 88 Dey St., N. Y.—[Or we will send one, post-paid, for \$1.00; or the finer style for \$1.50.]

**No. 186.—Watch Key (Cross Pattern).**

—This is made of Heavy Rolled Gold Plate, is self-ad-

justing, the same as No. 185. From same firm as No. 185. Two subscribers at \$1.50 each will secure this post-paid [or we will supply it and send it post-paid for \$1.50].

**No. 187.—Paint Box.**—This contains 24 Cakes

assorted Paints, 3 cups, 2 brushes, pencil, rubber, 6-inch rule, etc., all packed in a polished wood box; cover inlaid. From same firm as No. 188. Two subscribers at \$1.50 each will secure this [or we will supply it for \$1.50.] In either case send 25 cts. for postage.

**No. 188.—Paint Box.**—This box contains twenty Cakes Assorted Paints, four Cups and three Brushes, all packed in a stained wood box, carved cover, with hinges. From STERN & LYON, 20 Park Place, New York. Sending one new subscription at \$1.50, secures this [or we supply it for 75c.] If to go by mail, send us 10 cents for postage & packing.

**No. 189.—Magnet; Horse-shoe form, with armature; of hard steel and permanent; strong for its size; length 5 inches.** Rub a pocket-knife blade on the N end, hang it at the middle with a thread, and the open blade will turn and point south, or rub it on the other and it will point north. Needles and other articles of hardened steel will become magnets by rubbing them on one of the ends of this magnet, so that they will pick up and hold iron or steel. A pretty scientific toy for any one.—Any one himself a subscriber will be presented with this post-paid, for sending another subscriber at \$1.50 a year [or we will send it post-paid for 60 cents.] It is well worth having.

**No. 190.—Three Premiums in One.**—1st. Ornamental Tin Lunch Box, length 7 inches, width 4 inches, depth 2½ inches.—2d. Metal Folding Drinking

Cup, which folds up, and packs in a small tin box.—3d. Farrell's Combination Match Box, nickel plated, with Candlestick and Candle. From same firm as No. 170. One subscription at \$1.50 each, will secure them [or we supply them for 75 cents.] Send ten cents for postage.

**No. 191.—Ring Toss.**—This is a most interesting game for both old and young, can be played on lawn or parlor. The game is to throw the Rings over the target post at a given distance. All packed in a strong box together. From same firm as No. 173. Two subscribers at \$1.50 each will secure this [or we will supply it for \$1.25.] In either case send 20 cents for postage.

No. 192

"REMINGTON" MACHINE, PRICE \$50.

**No. 192.—Sewing Machine.**—The Remington Sewing Machine Company, Ilion, N. Y., or 281 Broadway, N. Y. City, manufacture a machine which has sprung rapidly into favor, as possessing a most desirable combination of good qualities, namely, light running, smooth, noiseless, rapid, durable, with perfect Lock-Stitch. Its use is readily acquired, it is well constructed, and beautiful in design. We send the \$50 machine. Presented this year for 43 subscribers, at \$1.50 each. Carriage to be paid by receiver.

**No. 193.—Pair of Scissors with Silver Thimble.**—The Scissors are 7 inches in length, nickel-plated handles, and of the best steel. The Thimble is

Coin Silver, warranted. From same firm as No. 19. Two subscriptions at \$1.50

each will secure both post-paid [or we will forward them for \$1.50]. In ordering, state the size of Thimble desired.

**No. 194.—Case of Scissors.**—The Case is of morocco, handsomely gotten up, and lined with velvet and satin, containing three first quality scissors, crooks finish, length 4, 5, and 5½ inches, respectively; a very pretty and useful Premium. Made by the UNITED

STATES STEEL SHEAR COMPANY, West Meriden, Ct., whose manufactures stand deservedly very high in the market. Furnished to us by the MERIDEN CUTLERY Co., 49 Chambers street, New York. Ladies can get this premium free, forwarded post-paid by mail, by sending a club of six subscribers, at \$1.50 each.—[Or we will send this set, pre-paid, on receipt of the price, \$4.00.]

**No. 195.—Lady's Handkerchief Bag.**—This is made of Black Leather, Morocco finished, Kid

lined, and Nickel trimmed. From SPELLMAN, BROS. 355 Broadway, N. Y. Two subscriptions at \$1.50 each, will secure this post-paid [or we will supply it for \$1.00, p.-p.]

**No. 196.—Sinclair's Young Puritan Rocker and Writing Table.**—It will be seen at once, from the engraving of this chair in use, that it is

designed for comfort and convenience, and the object aimed at has evidently been fully reached in these very easy, useful, strong, and roomy chairs. They are made by Mr. F. A. SINCLAIR, Syracuse, N. Y. The style we offer, including the Writing Table Attachment, price (\$9.25), will be presented for 11 subscribers, at \$1.50 each.

Freight or expressage from factory to be paid by receiver.

**No. 197.—Patent Magic Bell Head Pen-cil.**—This is a very pretty and convenient gold-plated Pocket Pencil, which is extended or closed by pulling or pressing the head. This premium and the seven which follow, are from the well known manufacturers, LUDDEN & Dow, 194 Broadway, New York. Mr. Ludden has been in the business 38 years, and we know and can highly commend his work. For Two subscribers sent us at \$1.50 each, we will present one and send it post-paid, [or we will send one, post-paid, for \$1.50.]

**No. 198.—Magic Charm Pencils.**—These are gold-plated and very beautiful. We offer two kinds, the smaller, an exceedingly tasteful thing for ladies, and a larger style for gentlemen. Each style has a ring at the head for attaching to a watch-chain. By same makers as No. 197. Three subscribers, at \$1.50 each, will secure the Ladies' size, free, post-paid, and 4 subscribers the Gentleman's size [We send the ladies' size, post-paid, for \$2, and the gentleman's size for \$2.75.]

**No. 199.—Gold Pen, Telescopic Case.**—Gold-plated case containing No. 4 Diamond-pointed Gold Pen, warranted. Same makers as No. 197. Only Four subscribers sent to us at \$1.50 each, will secure this splendid article free and post-paid. In sending for this pen indicate how you wish the pen—whether you desire it to be stiff, medium, or limber.—[We will send one of these fine Pens, post-paid, on receipt of \$2.50.]

**No. 200.—Gold Pen and Pencil (Combined.)**—A very elegant premium. The handsome, heaviest gold-plated Holder contains a No. 7 Improved Telescopic Pen and Pencil. In lined leather case. The pen slides out, the pencil is thrown out by drawing back the pencil head; chamber for leads in top. Same makers as No. 197.

This is richly worth the little effort to collect Seven subscribers at \$1.50 each.—[We supply one for \$5.50.] If to go by Mail, send us 14 cents for postage & packing

**No. 201.—Cannon Charm.**—A neat, miniature gold-plated cannon (fig. 1); by turning the muzzle end, a small pencil is brought out (fig. 2). LUDDEN & Dow, manufacturers, 194 Broadway, New York. Only 2 subscribers at \$1.50 each are needed to secure it, post-paid. [We will send one post-paid on receipt of \$1.25.]

**No. 202.—Watch-Bar, Tooth-pick, and Watch Key, combined.** A very pretty gold-plated charm for the watch guard. From same makers as No. 201. Two subscriptions at \$1.50 each will secure it, post-paid. [We will send one post-paid on receipt of \$1.25.]

**No. 203.—Desk-Pen and Holder.**—A ten carat gold pen, with gold-plated holder and ebony handle, in case, a neat and useful article. Same makers as No. 201. For 4 subscribers at \$1.50 each, we will send it post-paid. [Or, we will send one post-paid for \$2.25.]

**No. 204.—Desk-Pen and Holder.**—A fourteen carat gold pen, larger than No. 203, with handsome, gold-plated holder and ebony handle. An elegant desk-

pen,—a handsome present for a gentleman. Same makers as No. 201. In ordering any pen, state whether a stiff, medium, or limber one is wanted. For 6 subscriptions, at \$1.50 each, we will present one, and send it post-paid. [Or we will send one, post-paid, on receipt of \$4.00.]

**No. 205.—Companion Autograph Album.**—It has embossed gilt covers, round corners, and gilt edges. Fac-simile Autographs of Whittier, Longfellow, and Bryant, are embossed in gilt on the cover. Collecting and preserving the autographs of friends and others is a charming custom. There is also a great curiosity on the part of almost every one to see the autographs of distinguished people, and the Album which contains such names is highly prized. The COMPANION AUTO-

GRAPH ALBUM is one of the most attractive and valuable ever offered to the public. Besides the ordinary blank pages for collecting autographs, a new feature of great value is added. Over thirty of its 125 pages contain fac-simile autographs of distinguished poets, historians, statesmen, journalists, essayists, and novelists. In addition, in the hand-writing of the authors, are reproduced stanzas from several famous poems. These have been taken, in most cases, directly from the original manuscript, which adds great value to the collection. We will present it, and send it post-paid for 2 subscribers at \$1.50 each; [or we will supply it post-paid for \$1.00.]

**No. 206.—Album.**—Made of English Morocco, embossed in Gilt and Silver, and contains spaces for 12 Cabinets and 120 Cards. From KOCH, SONS & Co., 156 William Street, New York. We present this for 7 subscribers at \$1.50 each, [or we will supply it for \$6.00.] Expressage paid by recipient.

**No. 207.—Album.**—Made of Leatherette. Embossed in Gilt and Silver, with spaces for 10 Cabinets and 50 Cards. We will present this post-paid for 3 subscribers at \$1.50 each [or we will supply it post-paid for \$2.00.]

**No. 208.—Easel Album.**—Made of English Cloth, fancy colors, illuminated and embossed in gilt

and silver, spaces for 50 Carte de Visites. From same firm as No. 206. Four subscriptions at \$1.50 each will secure this post-paid [or we will mail it p.-p. for \$2.25.]

**No. 209.—Checker Board.**—Made of imitation wood, with Backgammon back, and will fold up;

size 15½×15½. A set of Cbeckers will be sent with each board. From same firm as No. 206. One subscription at \$1.50 will secure this sent post-paid [or we will supply it for seventy-five cents, and send it post-paid.]

**No. 210.—Family Electric Lighter.**—A useful and interesting scientific apparatus. A battery, partly filled, is so arranged that on pressing down the knob *F*, the zinc is immersed, a current of electricity is produced flowing through the wire *F*, and the small coiled platinum wire *O*. This heats it intensely so that it ignites the wick of the lamp *H*, almost instantly. This lamp is filled with common kerosene oil, and may be carried around, or used to light other large lamps, gas jets, etc. On removing the finger from *F*, the zinc rises out of the fluid, stopping the waste. It may be repeated some thousands of times, and then only requires a few cents worth of materials from the druggist to renew the liquid, for other thousands of lightings. The apparatus can stand on the mantle shelf or other convenient place, always ready for instant use, instead of matches, saving their cost, their sulphurous fumes, and the danger of fire from having them around. It goes complete with all needed chemicals, safely packed in a box, 5×7×8 inches. From JNO. D. LEVERIDGE, No. 3 Courtland St., N.Y. City. Five subscriptions of \$1.50 each, will secure this [or we will supply it for \$3.50]. Receiver to pay expressage.

**No. 211.—Williamson's Portemonnaies.**—These are made for Coins, also for Bills, and are provided with a separate tight flexible pocket, with a clip to facilitate the entry of the coins; be there one or many, they are securely held, and will not drop out, no matter how the book is placed. We offer two kinds—one made of Seal. Price, \$2.75. Four subscriptions at \$1.50 each, will secure this, post-paid. The other is of Imported Cloth. Price, \$2.25. Three subscriptions at \$1.50 each, will secure this, post-paid. [Or we will furnish either of them for the prices stated, post-paid]. These are furnished us by G. C. G. WILLIAMSON, 119 William St., New York.

**No. 212.—Umbrella Clothes Horse.**—This can be attached to any part of the room, is off the floor, and always out of the way. It is so arranged that when not in use, the bars can be taken out and hung on

the Iron Fixture, by the hook inserted in each bar. From same firm as No. 50. Two subscriptions at \$1.50 each secures this post-paid [or we will supply it for \$1.25].

**No. 213.—Moore's Floral Set.**—A complete set of **Ladies' or Children's Garden Tools**, for cultivating flowers, consisting of a *Floral Hoe, Spade, Fork and Rake*. Made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly finished, each set inclosed in a box. Very convenient in garden or greenhouse. They are useful, pleasing toys for the little folks. Presented for

Premium 213

only 2 subscribers, at \$1.50 each. Better get more subscribers for more sets, as half a dozen sets or so will come together cheaply as freight. Made by the MOORE MANUFACTURING CO., Kensington, Conn. [We supply one set for \$1.00.] Receivers to pay expressage. If to go by Mail, send us 25 cents for postage & packing.

**No. 214.—Carving Tools.**—Handles of Beech and polished. The tools are made from the best steel, and are sharp and ready for use. From the same firm as No. 17. Two subscriptions at \$1.50 each will secure these post-paid [or we will send them post-paid for \$1.00].

**No. 215.—Slide Vise.**—(Very convenient.)—This vise is of iron, with steel face and has a Clamp by which it can be attached to a table, and can be removed by turning a Thumb Screw. Width of Jaw, 1½ inches. From MILLER'S FALLS CO., 74 Chambers St., N. Y. Price, \$2. For Three subscriptions at \$1.50 each, we will present this Slide Vise [or we will supply one of them for \$2]. Sent by mail, prepaid, in either case.

**No. 216.—Companion Tool-Chest,**

**No. 1.**—This combination is well adjusted, and it is a convenience for the Family, Store, and Workshop.—It combines: A Rosewood Plane; One Gouge; One six-inch Box-wood Rule; One Medium Chisel; One inch Cutter, used also as a Chisel; One Screw Driver; One Saw; One Awl; One Gimlet. These tools are all made from the best cast steel. The chuck is beautifully Nickel Plated. It will hold a tool as small as a pin head. They are packed in a handsome box. For 2 subscribers at \$1.50 each, we send this free; [or supply it to any one, and send it, post-paid, for \$1.50.] It is a very handy combination for occupying so little room and for so small a price, and may well be obtained by any one who has not the same tools in some other form.

**No. 217.—Boy's Tool Chest.**—This Chest has 21 assorted tools, in a neat hinged-lid box, made of ash, with walnut moulding. Just the thing to encourage the mechanical genius in boys. Made by E. I. HORSMAN, 80 and 82 William St., New York City. Will be given for 4 subscribers at \$1.50 each, [or supplied for the price, \$3.00.] The receiver to pay expressage.

**No. 218.—Boy's Tool Chest.**—Still larger than No. 217 and from same maker. This contains thirty-two tools, and will be a fine present for any boy. It will be given for 8 subscribers at \$1.50 each [or we will supply one for \$6.00.] Recipient to pay the expressage.

**No. 219.—Men's Tool Chest.**—This contains an assortment of 40 good Tools, such as are most used; all packed in chestnut box, trimmed with black walnut. From same firm as No. 217. Twelve subscriptions at \$1.50 each will secure this [or we will supply it for \$10.00.] Receiver to pay expressage or freight.

**No. 220.—The New Blanchard Churn.**—Of the many kinds of apparatus made for converting Cream into Butter, the Blanchard Churn, manufactured by PORTER BLANCHARD'S SONS, Concord, N. H., stands among the best. The makers claim that the action of the dasher is such as to cause agitation of the cream by creating currents, and not by heating or friction of the cream. Four motions are given to the cream by one revolution of the crank. A reverse motion of the dasher gives a cam pressure to the butter by which the butter-milk may be all worked out, and the salt worked in, without removing the dasher. Facility of removing the dasher and getting at the butter. Ease of cleaning, the form of construction making the inside without any inaccessible or invisible angles or corners. For Nine subscriptions at \$1.50 each we will give one of these excellent churns [or, supply one for \$8.00], the receiver to pay freight in either case.

**No. 221 Improved Union Churn.**—

The accompanying cut represents a No. 2 Improved Union Churn, made by the UNION MANUFACTURING CO., of Toledo, O. These Churns have long been in the market, and have been widely used in the West and Northwest, where they are highly commended for their simplicity and durability. We can present one of these Churns to any one who will send us Eight subscribers at \$1.50 each [or we will supply one for \$6.50], receiver in either case to pay freight from factory.

**No. 222.—Rectangular Churn.**—This unique, yet successful butter maker has won its way to popularity by its merits. The action of the Churn is such that a complete agitation of the cream takes place at every revolution of the churn. After churning, the butter lies so loosely that the buttermilk can be drawn off and cold water put in for washing the butter, which is done by a few revolutions of the churn. These churns are made by Messrs. CORNISH & CURTIS, Fort Atkinson, Wisconsin, and we are able to present one of these useful household articles to any one who will send us Seven subscriptions at \$1.50 each [or we will furnish one for \$6.00]. The receiver to pay freight in either case,

**No. 223.—Americus Senior Cider and Wine Mill and Press combined.**—Many of our readers and friends raise grapes and apples, but not in sufficient amount to warrant sending a great distance to have fruit ground and pressed. To meet this want, THE WHITMAN AGRICULTURAL Co., of St. Louis, Mo., have invented and manufactured a Grinder and Press combined, secured in one frame, as shown in the engraving. It mashes the fruit perfectly; the rollers are adjustable, so as to grind each coarse or fine; easily cleaned, and every way desirable to the purchaser. With this excellent arrangement of the two machines, it requires but little room, and is always ready for immediate use for the largest or smallest quantity of fruit. On the receipt of 40 subscriptions at \$1.50 each, we will present one of these mills [or will forward one on the receipt of \$40], the receiver, in either case, to pay the freight. The Manufacturers will send full descriptions of the Mill and Press on application.

**No. 224.—Family Grind Stone.**—This is ten inches in diameter, securely fastened to a wooden stand, as represented in the engraving, well made, and will be found useful in every family. From MILLER'S FALLS CO., No. 74 Chambers St., N. Y. Four subscriptions at \$1.50 each, will secure this [or we supply it for \$2.50]. Receiver to pay expressage.

**No. 225.—The Whitman Corn and Cob Mill.**—These popular mills with steel grinders are warranted by the manufacturers—the WHITMAN AGRICULTURAL Co., of St. Louis, Mo.—to be superior to any other in use for all purposes. We will present one of these mills on receipt of Fifty subscribers at \$1.50 each [or will furnish one on receipt of \$50]. Receiver to pay freight from factory.

**No. 226.—The Monitor Corn Sheller.** Of the many implements invented and manufactured to lessen the labor of farm work, there has been no more popular little machine than the hand Corn Sheller made by LIVINGSTON & Co., of Pittsburgh, Pa., and called *Monitor Corn Sheller*. It is admirably adapted for shelling seed corn, where care must be taken in not breaking the outside covering of the kernel. It is easily adjusted to a bench or stool, and can be operated by a child. These Shellers are made of the very best material, fitted up in a workman-like manner, and will last any one a life-time with proper care. They have been awarded medals and diplomas by nearly all the leading Fairs in the Union, and are recommended by those who have used them, and speak from a knowledge of their value. Eight subscriptions, at \$1.50 each, will secure this useful article. [Or we will supply it on receipt of \$6]. The receiver pays express charges.

**No. 227.—Zimmerman Fruit-Dryer.**—Those who have not given the subject attention will be surprised at the magnitude of the fruit traffic in this country. In the canning business alone over five millions of dollars are invested. One of the easiest and best methods for procuring fruit is by drying, and of the many devices offered to the public none have been better received than Zimmerman's Fruit Dryer, made by the ZIMMERMAN FRUIT DRYER Co., of Cincinnati, Ohio. In order that our readers may secure one of these useful articles at comparatively small cost, we have arranged with the Company to present one of these Dryers to any one sending us 35 subscriptions at \$1.50 each [or we will furnish one for \$35.00]. The receiver to pay freight.

**No. 228.—Farmers Friend Combined Grain and Fertilizer Co. Drill.**—Of all the improved implements for doing work on the farm, the Grain Drill takes rank with the Mower and Reaper. In order that such readers of the *American Agriculturist* as are not supplied may obtain one, we have arranged with the FARMERS FRIEND M'FG Co., of Dayton, Ohio, to furnish this excellent Drill to any one who will forward us 70 subscriptions at \$1.50 each. [Or we will supply one for \$70.00]. Receiver to pay freight. A full descriptive circular sent on addressing the manufacturers, as above.

**No. 229.—The Gale Horse Hay-Rake.**—This labor-saving implement, doing the work better and faster than half a dozen men with hand-rakes, is wanted on every farm. The annual interest on its cost, is about the same as the cost of one day's work and board of a man. We have arranged with the GALE MANUFACTURING Co., Albion, Michigan, to offer this excellent and cheap \$25 Horse-Rake, as a Premium for subscriptions. Send to the Company for fuller descriptions if desired. On the receipt of 25 subscriptions at \$1.50 each, we will present one of these Rakes [or will furnish one for \$25]. The receiver to pay the freight from the manufactory.

**No. 230.—Halladay Windmills.**—The accompanying engraving represents the head of one of the Halladay Windmills. They are manufactured by the U. S. WIND ENGINE AND PUMP Co., of Batavia, Illinois, one of the largest and most successful builders in the United States. These mills have been adopted by many leading rail-roads at the West, for pumping water at stations, and have given the best of satisfaction. They are made of all sizes, for both farm and manufacturing uses. 110 subscriptions at \$1.50 each, will secure one of these Mills with full directions for building the derrick which can be done by any carpenter. Or to such as may prefer we will ship one of the Champion Windmills made by POWELL & DOUGLAS, Waukegan, Ill., on the receipt of 100 subscriptions, at \$1.50 each. The receiver in either case to pay the freight from the Factory.

**No. 231.—The Gale Chilled Plow.**—This excellent improved plow is worthy of special attention, and we are glad to be able to supply one without cost, to at least one farmer in every neighborhood, who will simply take the trouble to gather a club of 20 subscribers to the *American Agriculturist* at \$1.50 a year. [Send your address, on a postal card, to the GALE MANUFACTURING COMPANY, Albion, Michigan, asking for full description, and it will be sent you free]. The engraving above, shows one of these Chilled Plows with *iron beam*, which is claimed to be far superior to the wooden beam. (Those preferring, can have the wood beam at same price). Our Premium Plow includes Wrench, extra Point, and the useful Jointer and Wheel, all without extra charge. Price of the whole, \$17.00, for which price we will supply it, or send it complete, as above, for 20 subscriptions. Freight from manufactory to be paid by the recipient.

**No. 232.—Matthews' Garden Seed Drill.**—This is regarded as one of the most valuable implements in use. Medals and testimonials confirming its superiority have been repeatedly bestowed upon it. It is designed to be used either in field or garden. In operation, it opens the furrow, drops the seed accurately at the desired depth, covers it, and lightly rolls it, and at the same time marks the next row, all of which is done with mechanical precision, by simply pushing the drill forward. In this way it sows, with an evenness and rapidity impossible for the most skillful hand to do, all the different varieties of beet, carrot, onion, turnip, parsnip, sage, spinach, sorghum, peas, beans, broom corn, fodder corn, etc. The drill is complete in all its arrangements, and is very durable. There are no cams, gears, springs, or belts, to get out of order, nor are there any parts subject to unusual wear, and, with fair usage, it will last many years, and do a vast amount of service, without requiring

Premium 232.

any repairs. Made by EVERETT & SMALL, Boston, Mass. This fine implement given for 15 subscribers, at \$1.50 each. [We will supply one for \$13.] Receiver to pay carriage.

**No. 233.—Sargent's Monitor Seed Drill.**—Made entirely of metal; light, strong, and durable. To this machine have been awarded two "First Premiums," and also a diploma at the Massachusetts Mechanics' Charitable Association in 1874. It was awarded the first prize at the Centennial Exposition in 1876, and it has received hundreds of endorsements and

most favorable testimonials from practical agriculturists who have used it. (We have used one with very great satisfaction). The manufacturers claim that this machine is radically different from all others, and that while it does everything that is done by other machines equally well, it effects other results, fully as important which competing machines do not even attempt. It is manufactured by the MERRIMAC MACHINE COMPANY, Newburyport, Mass. It will be presented by us for 15 subscriptions, at \$1.50 each. [Or we will supply one for \$10.] Carriage in either case to be paid by the receiver.

**No. 234.—A Farm Wagon, of Extra Quality,** with the new and valuable Holmes Skein, which saves side draft, and allows oiling without removing wheels. Strongly made with the best materials, and every way desirable on any farm. It is a sufficient recommendation to say it is made at the large and most reputable manufactory of FISH, Bros. & Co., at Racine, Wisconsin. (All are invited to send postals to them for full description of this wagon and its special features.) To meet the wants of our readers needing such a wagon, but who have more time than ready cash, we have arranged to present one of these wagons, complete, including Top-Box, Spring Seat, Whistle-trees, Neck-Yoke and Wrench, to any one sending us 80 subscribers at the regular rate of \$1.50 a year. [We will supply one complete as above for the price, \$80.00.] Receiver to pay the freight from the manufactory. Here is a capital chance for many a farmer (or his sons) to get an A 1, full size Wagon, without expense, and with only a little trouble by gathering 80 subscriptions during the Autumn or Winter, in his own or adjoining neighborhoods.

**No. 235.—Cahoon's Broadcast Seed-Sower.**—This Hand Seed-Sower sows from four to

Prem. 235.

eight acres per hour, at a common walking gait, throwing wheat and rye from 30 to 36 feet wide; barley, 30 feet; hemp, 28 feet; oats, 23 feet; clover, Millet and Hungarian seed, 22 feet; and Timothy, 18 feet. Price, \$6. Presented to any sender of 8 subscribers for *Agriculturist*, at \$1.50 each. It is manufactured by the GOODELL Co., at Antrim, N. H.—[We will supply one on receipt of the price, \$6.] Receiver to pay express charges.

**No. 236.—Bookwalter Engine.**—There are many of our readers who desire power for sawing

wood, thrashing grain, and a hundred other purposes. In order to enable those who want such power an opportunity to obtain a small steam engine and boiler complete, we have arranged with JAMES LEFFEL & Co., of Springfield, Ohio, to furnish one or more of these Bookwalter Engines, which we will present to any one who will send us 240 subscriptions at \$1.50 each, [or we will supply one for \$240]. The receiver to pay freight in either case. These engines are pro-

nounced by practical engineers and mechanics to be the most compact, substantial and economical engines ever offered to the public. Its superior construction, and ease of management, at once commends it to those who understand the use of such machinery.—Every boiler and engine thoroughly tested before being sold. The above is the price for engine boiler, governor, pump, etc. complete.

**No. 237.—Pocket Tool Holder.**—(See Engraving.)—Every boy (or man) will be glad to get hold of this Premium. We kept a similar, but less perfect set in use many years, and found it *very convenient* for a thousand little jobs. In a maple handle, which is hollow, with a lignum-vitæ head, are packed *twenty* small cast-steel tools, any one of which may be quickly adjusted to the handle. It will also hold for using, anything from an 8-inch mill-file to a cambric needle. Only 2 subscribers, at \$1.50 each, sent to us will secure you a *free* set, post-paid. These are made for us by

Premium 237

the MILLER'S FALLS MANUFACTURING Co., 74 Chambers St., New York.—[We will send one, post-paid, for \$1.00.]

**No. 238.—The Planet, Jr., Garden Drill, Wheel Hoe, Wheel Cultivator, and Wheel Plow, Combined.**—This combination of garden tools is one of the most valuable ever offered to our readers. The four engravings show a portion of the combinations. As a Drill, it is capable of sowing the whole list of garden seeds, being furnished with an adjustable opening plow, patent dropping and covering devices, and a marker and roller. As a Wheel Hoe, it hoes close and thoroughly the smallest plants. As a Wheel Cultivator, one can do as much with it as six with hand hoes. In addition to these useful combinations, the tool is provided with an elegant polished steel plow, an ever useful assistant in the garden from spring until fall. The makers claim that this combination is the most valuable ever offered to the gardener. The price is but little more than that of an ordinary seed-drill, yet the additional combinations are many times more useful than the drill alone. Descriptive catalogues will be sent on application by postal card to the manufacturers, S. L. ALLEN & Co., 229 Market St., Philadelphia, Pa. We present this premium for 16 subscriptions at \$1.50 each. [Or we will supply the apparatus for \$14.] Freight in either case to be paid by receiver.

**No. 239.—The Planet, Jr., Double Wheel Hoe, Wheel Plow and Cultivator.**—Garden and drilled crops must be hoed constantly, and this tool, in its present improved form, does its work so much more closely and perfectly than the most skilled hand labor, that no market gardener, root grower, onion grower, nurseryman, or plant grower can afford to be without one. The great ease and speed with which the work of hoeing drilled crops can be accomplished with this tool, makes it possible to tend a large crop at the proper time. All are tempered steel, handsomely polished. The advantages of a good Double Wheel Hoe are numerous; working both sides of the same row at once, all bends in the row are readily followed, and the work done far closer and better, and also easier, from the attention being directed to but one row at a time. The tool weighs about 20 pounds, and being used with a stroke and punching motion, is very effective

in all kinds of soil. From same makers as No. 238. *Eleven* subscriptions at \$1.50 each will secure this. [Or we will supply it on receipt of the price, \$9.] Receiver in either case to pay for transportation from the manufactory.

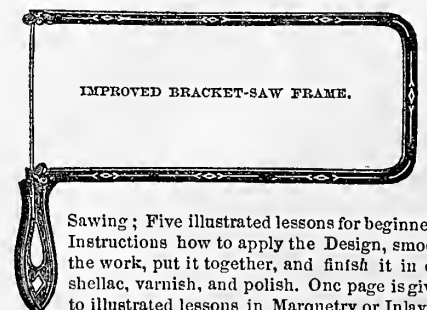

**No. 239.—Firefly Hand Hoe and Garden Plow.**—For garden use. This hand hoe, adjustable for depth, and steadied by the wheel, is a most admirable tool for the vegetable garden, doing the work every way in an excellent manner. With it almost the whole work of a garden can be accomplished with ease, thoroughness, and rapidity, the slight weeding or hoeing needed directly in the row excepted. 5 subscriptions, at \$1.50 each, will secure this. [Or we will send one on receipt of \$3.50.] Receiver in either case to pay carriage by express or freight. These Hand Hoes are made by S. L. ALLEN & Co., Philadelphia, Pa.

**No. 240.—Victor Five-Hoed Seed Drill.**—There are many farmers who do not feel able to invest a large sum of money in farm implements. Many such persons have small farms that require but little labor to cultivate them. To meet a long felt want by this class of most worthy citizens, Mr. EDWARD OVER, of Indianapolis, Ind., has invented and perfected a five-hoed Seed Drill, to be operated by one horse. These drills are provided with a graduated forced feed and do their work as well as the best ten-hoed drill in the market, and are especially adapted for sowing small grain of all kinds. They are substantially made, light in weight, and cheap in price. For 25 subscribers we will present one of these five-hoed drills [or will send one on receipt of the price, \$25.] the receiver to pay freight in each case.

**No. 241.—Porter's Derrick and Hay Carrier.**—There are many farmers who find it a long and laborious task to stack their hay and straw in the field. In order to enable any of our readers to expedite their labor, we have arranged to present to any one who will forward us *Forty* subscribers at \$1.50 each, one of these Wire Cable Derricks, made by J. E. PORTER, Ottawa, Ill. [or will forward one on receipt of the retail price,] \$40, the receiver in either case to pay express charges. The Derrick is sent complete, except the poles, which can be obtained by any one.

**No. 242.—Improved Bracket-Saw Outfit.**—This fine "Improved Outfit" consists of: 1 Beautiful Box; 1 Steel Saw Frame, Japanned and Finely Ornamented; 50 Bracket and Ornamental Designs; 1/2 Doz. Steel Saw Blades; 1 Brad Awl; 1 Piece Sand Paper; 85 miniature Designs, of full size, with a price list; 1 Manual of Instructions, 12 pages, Illustrated, giving description of all tools and woods used in Bracket

Sawing; Five illustrated lessons for beginners; Instructions how to apply the Design, smooth the work, put it together, and finish it in oil, shellac, varnish, and polish. One page is given to illustrated lessons in Marquetry or Inlaying work. For *Two* subscriptions at \$1.50 each, we will mail this *free*; [or we will supply it, *post-paid*, for \$1.18.]

**No. 243.—New Folding Fret Saw.**

Every home, however humble or magnificent, is more beautiful if adorned with brackets and other work produced by home hands. Hundreds of thousands of such homes now exist, where only the slow and tedious hand frame fret saws have been available. More recently the foot-pedal and multiplying wheels have come into use, and the increasing demand has tended to cheapness and improvement. We are now happy to announce another large advance in Perfection, Cheapness, and Portability, by which are secured stronger, better working machines; a material reduction in price, and a great saving in cost of carriage or delivery, as well as in storage room when not in use, with sundry other improvements and advantages.—All the above are secured in this new saw. By a simple arrangement the table is lowered to a convenient working height for a boy of 5 or 6, or raised high enough for the tallest man, and at every height it stands firmly, and when not in use, it can be folded up and put away. It has a tilting table, and will execute fine scroll-work or inlaid work. Though as strong and durable as any one could desire, the weight is only 15 LBS. The Editors and Publishers of the *American Agriculturist* were so pleased with this new machine that they at once secured the control of it for the benefit of their readers. Four subscriptions at \$1.50 each, will secure this [or we will supply it for \$2.25]. Receiver to pay expressage.

**No. 244.—Combination Fret Saw, Lathe, etc.**—Beach's New Improved American Combination Fret Saw, Handsome in Design, and claimed to be the Lightest Running and Best Made Tool in the World for the Price; and unequalled for Cheapness,

Simplicity, Speed, and Efficiency. Several engravings and much space would be required to explain all its parts, and its working, ingenious improvements, etc.

Full descriptive circulars sent when desired. Is built almost wholly of iron and steel; stands firmly without fastening down. Will cut Horn, Ivory, Pearl, Shell, Brass, and all kinds of Wood up to 1½ inch thick. Saw runs straight up and down. Has a tilting table to cut at angles. Has Air-pump which drives all sawdust from

the work. Has 20 inches swing, for largest Brackets. Has **Drill Attachment** always ready for use. Also **Turning Lathe** for work 12 inches long, and 4 inches diameter, with speed of 1,500 revolutions per minute. Also set of **Steel Turning Chisels**, made from *Jessup's Best Improved English Steel*. Price complete, including *Lathe and Drilling Attachment*, one Morse Flint Drill, Wrench, Oil Can, Screw-driver, six Improved Fret Saws, and one large Saw 3¼-inch wide for cutting up timber. Also one set of **Turning Chisels**, boxed tight, and delivered on ear at Factory all for \$8—a reduction of \$3 from last year's price.—We will present the above for *Twelve* subscriptions at \$1.50 each [or supply it for \$8.00]. The freight to be paid by Receiver.

**No. 245.—Hand-Drill.**—A very useful little tool. The Drill Stock, and Six Drill Points, are packed in a box. From MILLER'S FALLS CO., 74 Chambers St., N. Y. For *One* subscriber at \$1.50, we will mail the Drill, post-paid, [or mail it to any one for 60 cents.]

**No. 246.—Designs for Scroll Saw.**—This Premium consists of one dozen Ornamental Designs for Scroll or Fret Saw. *One* subscription, at \$1.50, will secure these [or we supply them for 75c., post-paid].

**No. 247.—Turn-table Apple Parer, Improved.—No. 248. Climax Apple Corer and Slicer.—No. 249. Family Cherry Stoner.—No. 250. Bay State Apple Paring and Slicing Machine.—No. 251. "Saratoga" Potato Peeler and Slicer.**

—(See Engraving.)—All the above machines are most useful in every household where apples, cherries, and potatoes are to be cared for. Manufactured by the GOODELL CO., Antrim, N. H. We have never seen the work for which these machines were contrived, more rapidly or better done, than they will do it. The Apples are pared, cored, and sliced with the greatest facility, and the Cherries are readily relieved of their stones, leaving the fruit in good shape. The "Bay State Parer and Slicer" has a new attachment to the Knife Head which cuts the Apple into slices, and places them at one side, in a dish on the table. The "Saratoga" slices and peels the potato at one operation, and is a very ingenious and useful contrivance. Only *two* subscribers, at \$1.50 each, are required to get any one of the above, except No. 250, which requires *three* subscribers. For *seven* subscribers at \$1.50 each, we present the *whole* (5). [Or we will supply any one of them for \$1.00, except No. 250, which is \$1.50. Receiver to pay expressage.]

**No. 252.—Crandall's Two Jolly Blacks.**—Fun and frolic. This is a Mechanical Toy without clock-work. It runs on four wheels, and, when set in motion, the figures, which are brightly colored, with jointed limbs, perform what may well be called a jolly dance. The whole toy is very strongly made. When not in use the figures can be packed in the box on which they

dance. *One new* subscription at \$1.50 secures this, post-paid. [Or we will send it, post-paid, on receipt of 70 cents.]

**No. 253.—Crandall's Donkey and Rider.**—This is a most comical and pleasing Mechanical Toy, being a good specimen of Barnum's Tricky Mule. When drawn around, the Mule seems to be trying to throw its Dusky Rider, who assumes various grotesque

positions, and has a lively time to keep his seat. The toy is strongly made, of wood, beautifully painted; can be taken apart and packed in the box on which it performs. *One new* subscription, at \$1.50, secures this, post-paid. [Or we will mail one, post paid, for 70 cents.]

**No. 254. — Crandall's Chinese Blocks.**—In this most attractive combination, Mr. Crandall gives us the original Building Blocks, with an entire Chinese Family, the various blocks and figures be-

ing brilliantly colored. With a single Box, which contains a Set, one can build Chinese Houses, Palaces, Pagodas, Gardens, etc., etc. Thousands of structures of the Chinese style can be made with a Box of these fascinating blocks and figures. *Two* subscriptions at \$1.50 each, will secure this *free*, carriage pre-paid to any part of the United States. [Or we will send a box anywhere in the United States, prepaid, on receipt of \$1.25.]

**No. 255.—Crandall's Lively Horseman.**

—This Mechanical Toy has no clock-work, and performs without winding up. It has all the features of a Circus Rider going through the wonderful feats of that profession. The Horse and Rider are of wood, finely painted. Can be taken apart and packed in the box on which it performs. A child can draw it around without any danger of breaking it. One new subscription, at \$1.50, secures this, post-paid. [Send one, post-paid, for 70 cents.]

**No. 256.—Crandall's District School.**

—This very amusing group of teacher and scholars in the "district school" will delight every Child, and Man and Woman too. The grave "Master," seated by the desk, with his "whisking stick"; the boys and

girls with their books; the "Little Lamb" that has followed Mary to school; "Dunce" and his cap, and the altogether comical appearance of the whole company, make this one of the most attractive toys of Crandall's invention. Two subscribers at \$1.50 each, will secure a box, postage prepaid. [We send one, post-paid, for \$1.20.]

**No. 257.—Citadelle—A Pleasing Parlor Game.**—Size of Board, 10x38 inches, with Balls, Cues, etc. Each player has five turns in sending the ball against the Citadel. The most accurate marksman will score the highest number of points and win the game. WARNER & Co., Northampton, Mass., are the makers. Only 2 subscriptions at \$1.50 each, will secure this Game; [or we will supply one on receipt of \$1.00.] Expressage to be paid in either case by the receiver.

**No. 253.—Tammany Bank.**

—This is a good substantial Bank. The man holds his hand to receive the coin, and when placed in it, the weight causes him to drop the coin into his pocket, which touches a spring, and he makes a bow. From same firm as No. 259. Two subscriptions at \$1.50 each, secures this [or sold for \$1.00]. Recipient to pay express charges. (The Tammany Bank weighs 32 ounces.)

☞ If to go by mail, send us 32 cents for postage & packing.

**No. 259.—Parcheesi.**—This game is designed so plainly and attractively that it is quickly comprehended by children, and also excites interest in the oldest players. It is bound in durable, handsome paper, with 8 dice, 16 brass-bound counters, and directions for playing. From E. G. SELCHOW & Co. We present it for 2 subscribers at \$1.50 each [or supply it for \$1.50.] ☞ If to go by Mail, send us 15c. for postage and packing.

**No. 260.—"Go-Bang."**—The new East India parlor game. It is pronounced by many, the best parlor game of the day. Directions for playing it, accompany each one. From same firm as No. 259. Presented for 2 subscribers at \$1.50 each [or we will supply it for \$1.00]. ☞ If to go by Mail, send us 15 cents for postage & packing.

**No. 261.—Creedmoor Bank.**—This is quite an ingenious affair. The man's head moves forward, you draw back the spring in the gun, then place a coin in front of the spring, touch the right foot, and the gun shoots the coin into the stump and rings a bell. From same firm as No. 259. Two subscriptions at \$1.50 will secure this [or we will supply it for \$1.25], the recipient to pay express charges in either case. (Weights 50 ounces.) ☞ If to go by mail, send us 50 cents for postage & packing.

**No. 262.—Crandall's Treasure Box.**—This is one of Crandall's latest and best inventions. It is not a single toy, but a dozen in one, comprising a Wagon, Top, Bedstead, 2 Chairs, Wheelbarrow, Mallet, Bench, Table, Puzzle, Set of A B C Blocks, a group of nine Domestic Animals, and a pretty, Suburban Village. A most delightful combination for the little folks. Price \$1.00. Two subscriptions at \$1.50 each, will secure this. Receiver to pay expressage. Too large to go by mail.

**No. 263.—Walnut Work Box.**—A pleasing gift for a young Miss. It is a 12-inch solid walnut Box, cushion, etc., inside velvet finish. From same manufacturer as No. 277. Two subscriptions at \$1.50 each will secure it, [or we will supply it for the price, \$1.25.] Receiver to pay expressage in either case.

**No. 264.—Sliced Objects; Sliced Birds; Sliced Animals.**—These pleasing, dissected puzzles, or "sliced" objects, etc., are designed to attract and interest the little folks, as they invariably do, and at the same time help them in learning to spell. The engraving of a "Boat," shows how the objects, ani-

**SLICED OBJECTS**

mals, etc., are divided into sections. They are very popular with children, as they are got up in attractive style. From E. G. SELCHOW & Co. The "Objects," or "the Birds," or the "Animals," will be presented for only one new subscriber at \$1.50 [or for 50c.]. Name the one desired. ☞ If to go by Mail, send us 15 cents for postage & packing.

**No. 265.—Crandall's Sectional A B C Blocks.**—A beautiful thing for little scholars. They learn while they play. All the letters of the Alphabet can be made with this set of Sectional Blocks. The ingenuity of the young operator is developed, and, while placing together the various sections of these attractive blocks, the little boy or girl unconsciously learns the Alphabet. Many pleasing structures can also be made by joining the pieces in various ways. The blocks are very brilliantly colored with fine paint, and are made strong and durable. A handsome illustrated Chart goes with each box, and adds brilliancy to the toy. Two subscriptions at \$1.50 each, will secure this, post-paid. [Or we will supply a box, post-paid, on receipt of \$1.00.]

**No. 266.—Girl's Polished Metal Tea Set.**—This consists of Tea-pot, Sugar Bowl, Milk Pitcher, six Cups and six Saucers, six Teaspoons and Sugar Tongs, and is very strong and durable. From same firm as No. 58. Two new subscriptions, at \$1.50 each, will secure this. [Or we will supply the set for \$1.50.] ☞ If to go by mail, send us 20 cents for postage & packing.

**No. 267.—Girl's China Tea-Set.**—This consists of six Cups and six Saucers, six Plates, Tea-Pot, Milk Pitcher, and Sugar Bowl, handsomely decorated in gilt and colors, packed in a box. From same firm as No. 58. Four subscriptions at \$1.50 each, will secure this as a premium, [or we will supply the set for the price, \$2.50], the expressage to be paid by the recipient.

**No. 268.—Girl's Wash Set.**—This is composed of six pieces, viz.: Washboard, Wringer, Pail, Clothes-horse, Scrub-brush, and brass-bound Tub 10 inches in diameter. From same manufacturer as No. 277. One new subscriber at \$1.50 will secure it. [Or we will supply it for the price, 75 cts.] Receiver to pay expressage. ☞ If to go by Mail, send us 20 cents for postage & packing.

**No. 269.—Doll's Kitchen Set.**—This contains a variety of articles, such as Pans, Kettles, Coffee-Mill, etc., etc. Made of tin, and packed in a box. From same firm as No. 58. Two subscriptions at \$1.50 each, secures this, post-paid [or we supply it, post-paid, for \$1.]

**No. 270.—Whistling Locomotive.**—This new Toy is a marvel as to its simplicity. At every revolution of the "driving wheels" there is produced a good strong whistle, which adds greatly to the pleasure of the boy or girl who runs it. It is 27 inches in length, and 10½ inches in height, and showily painted. *Two* subscriptions at \$1.50 each, will secure this [or we will supply it for \$1.00]. Receiver to pay expressage.

**No. 271.—Doll House.**—This House is 21 inches in length, 13½ inches wide, 19 inches deep; it is made of Wood, with slanting roof, painted and ornamented inside and out; the windows are glass, with curtains to each, and the floor is fancily covered. A suit of Furniture will accompany each house. It is so made that it can be taken apart and packed in a box. *Six* subscriptions at \$1.50 each, will secure this. [Or we will supply it for \$4.00.] Receiver to pay expressage.

**No. 272.—Crandall's New Acrobats.**—Most brilliant in costume, and full of fun and frolic. The "New" Acrobats are a great improvement upon the old style, which created such an excitement among the little folks. These are among the most fascinating and ingenious toys ever invented. The hundreds of figures which can be made with the pieces in a single box is limited only by the ingenuity of the operator. For one new subscription, at \$1.50, we will present a box and send it post-paid. [Or we will send a box, post-paid, for 65 cents.]

ous toys ever invented. The hundreds of figures which can be made with the pieces in a single box is limited only by the ingenuity of the operator. For one new subscription, at \$1.50, we will present a box and send it post-paid. [Or we will send a box, post-paid, for 65 cents.]

**No. 273.—Toy Furniture.**—This is made of White Holly, or Black Walnut, and consists of six pieces, viz., 1 Sofa, 1 Rocker, 1 Arm Chair, 1 Centre Table, and 2 Chairs, with Cushioned Bottoms. *One* subscription

at \$1.50, will secure this set [or we will supply it for 75c.] Send 16 cents for postage, if to go by mail.

**No. 274.—Toy Furniture.**—This is made of White Holly, or Black Walnut, and contains seven pieces, viz., 1 Sofa, 1 Rocker, 1 Arm Chair, 1 Centre Table, and 3 Chairs, with Cushioned Bottoms. *Two* subscriptions at \$1.50 each,

will secure this [or we will supply it for \$1.00]. Send 16 cents for postage, if to go by mail.

**No. 275.—Toy Steam Engine Eclipse.**

\$1.00 cash, post-paid.]

**No. 276.—Horizontal Boy's Engine.**—

This has Brass Boiler, regular Safety Valve, Brass Pipe connecting Boiler with Steam Chest, one-inch stroke, cross-head running on steel ways. Length, 6 inches; height, 4½ inches. All packed in a box, with Lamp, Funnel, etc. From same firm as No. 275. *Four* subscriptions at \$1.50 each, will secure this, post-paid. [Or we mail it, post-paid, for \$2.50.]

**No. 277.—Portable Writing Desk.**—

Always handy, especially for the young folks. Closed, it is a 12-inch square black walnut desk. From C. W. F. DARE, 47 Cortlandt St., New York City. *Two* subscribers

at \$1.50 each will secure this. [We will supply one for \$1.25]. Receiver to pay expressage.

**No. 278.—Patent Four-Wheeled Propeller.**—This is strongly made, handsomely Painted and Varnished, Seat Upholstered in Enamel Cloth. Can be used by girls or boys from 5 to 16 years of age. From same firm as No. 277. Price, \$7.50. *Eight* subscriptions at \$1.50 each, will secure this [or, we will supply it for \$7.50], the expressage to be paid by the recipient, in either case.

**No. 279.—Parlor Floor Croquet.**—Very neatly made and finished. Size adapted for either adults or children. The Wickets are so arranged that they will not injure the carpets, consisting of 4 Balls, 4 Mallets, 10 Arches, pointed so as to pierce the carpet, and 2 Stakes; all put up in a neat white box. From E. G. SELCHOW & Co., 41 John St., New York. We will present this for *Two* subscribers at \$1.50 each [or we will supply it for \$1.50.] Expressage paid by recipient.

**No. 280.—"Our Boys'" Wagon.**—For the use of Boys from 6 to 15 years of age. The bed is 2 ft. 8 in. long, 1 foot 3 in. wide, and 5 in. deep. The wheels are all iron, the spindles also of iron. It is finely painted, a first-rate and handsome wagon, and will carry a weight of 400 to 500 lbs. on a level road. Made by the SILVER & DEMING M'f'g Co., Salem, Ohio. Presented for only 10 subscriptions, at \$1.50 each, [or we supply one for \$8.] The freight from the factory paid by receiver.

**No. 281.—Boy's Wagon.**—Just the thing for the active little "drivers" at home. This Wagon has iron axle, and heavy round tire wheels, painted and ornamented with bright colors, has hub caps and seat, with 28-inch body. From C. W. F. DARE, 47 Cortlandt St., New York. A

father, mother, or older brother or sister ought to easily collect the 7 subscribers which will get this.—[Or we will supply one for \$5.00.] Receiver to pay expressage.

**No. 282.—Doll Perambulator.**—This has

9 and 12-inch wheels, painted, varnished, and ornamented, large sized body, enamelled cloth Seat, with Canopy Top. From same firm as No. 281. *Two* subscriptions sent, at \$1.50 each, will secure this [or we will supply it for \$1.50.] The expressage to be paid by the recipient.

**No. 283.—Tally-Ho Perambulator.**—Same as No. 284, but of superior quality. Upholstered with Enamel Cloth, has carpet on the bottom, full length Seat-rail, Dash-rail, Handle-tips, and the Canopy Top will turn forward or backwards. The body is hung between two full "C" Springs, pivoted to the side, which produces a soft and easy motion. The Axles are of Iron; Oval Tires on wheels. Handsomely Painted, Varnished and Ornamented. It is a most desirable article. From same firm as No. 284. Presented for 15 subscriptions at \$1.50 each, [or we will supply it for the low price of \$12.00.] The expressage to be paid by recipient, in either case.

**No. 284. — Tally-Ho Perambulator.** — The newest and by far the best for carrying a child out. The Top can be readily set upright, or backward or forward at any angle, to shut off the sun, and will stay firmly when set. Closely packed in the top, is a set of curtains, of which one or more can be quickly let down, as wanted, at either, or both sides, and at the back. No. 284, has patent Valise Canopy Top. The Seat is upholstered with Enamel Cloth, the Axles are Iron, with Steel Springs, front and back, and Oval-tired Wheels, Handle-tips, Hub Caps. Painted, Varnished, and Ornamented. From C. W. F. DARE, 47 Cortlandt St., New York. Twelve subscriptions at \$1.50 each, will secure this for we will supply it for \$9.00. The expressage to be paid by the recipient, in either case.

**No. 285. — Boy's Velocipede.** — (3 wheels), strongly made, has two 16 and one 18-inch oval-tired Wheels, Handle-tips, Leather Quilt Saddle, handsomely Painted and Varnished, suitable for boys from 4 to 6 years of age. From same firm as No. 284. Six subscriptions at \$1.50 each, will secure this for, we will supply it for \$5.00, expressage to be paid by the recipient.

**No. 296. — Pedestrianism.** — A very fine new Parlor Game for boys, and their Sisters and their Cousins and their Aunts, and their Parents too. It is wanted in every family. Two, three, or four persons may enter the race represented by this game. The rules and conditions of the game are distinctly printed on the face of it. This game is a most interesting one, both to players and spectators, and though but recently intro-

duced, it is already in great demand, and will soon be in most families. We present it post-paid for 2 subscriptions, at \$1.50 each. [Or we will send it post-paid for \$1.25.]

**No. 297. — Billiardette.** — The above engraving represents this fascinating game. Size of the board is 5 ft. 10 inches by 2 ft. 1 inch. Send your address on a Postal to this office for full descriptive circulars.

No. 1 is very neatly gotten up, and is an ornament for any room. There are ten balls and one cue put up with every table, together with printed instructions. We will present it for 10 subscriptions, at \$1.50 each, [or supply it for \$8.00]. No. 2 is of the same size as the above, but is made of Fine Black-walnut, the surface covered with Extra Fine Billiard Cloth, and the balls are of Zugello. We will present it for 12 subscriptions, at \$1.50 each. The board being quite light, it can be placed on an ordinary table, and when it is not in use, it can be put away in a very small space, or be set up against the side of the room. We send one complete for \$10. Each Board goes packed in a stout box. Freight to be paid by recipient.

**No. 298. — Lloyd's "Dollar Maps."** — We have made arrangements with the well-known Map Publishers, Messrs. H. H. LLOYD & Co., 174 Fulton St., New York, for the supply of their beautiful series of Dollar Maps. For two subscriptions at \$1.50 each, we will present, post-paid, any one of the following Maps, the selection to be named when the Premium is ordered: — 1. **United States (complete).** — This contains more names than most maps several times the size. The selection of places is according to their importance. All Railroads and all important Towns and Stations are shown. It is one of the best Maps for the money ever offered. — 2. **North-eastern States.** — It embraces New England, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Kentucky, Ohio, Indiana, Michigan, and nearly all of Wisconsin and Illinois, also Ontario and Quebec, and the entire Lake Region is shown. — 3. **Western States.** — A County and Railroad Map. Very Complete. Showing Post-Offices and Stations very fully. The States of Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Kansas, Nebraska, Dakota, and most of Missouri and Kentucky are shown. — 4. **Southern States.** — It is similar to the Map of the Western States. It shows the States of Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Arkansas, Missouri, Tennessee, Kentucky, and portions of Texas and other States. — 5. **South-western States.** — Contains Texas, Louisiana, Mississippi, Arkansas, Indian Territory, and most of New Mexico. — **The World** on Mercator's Projection, together with Maps of the Northern and Southern Hemispheres and Eastern and Western Hemispheres in globular form. Also a Map of Ocean Currents. — 7. **Pictorial Chart of the World.** — A very attractive and comprehensive work, containing a small Map of the World on Mercator's Projection; a Globular World; Heights of Mountains; Comparative Heights of the Principal Water-Falls; Length of Rivers; a Time Dial; Great Battles and Sieges of the World; Remarkable Discoveries and Inventions; Population of Principal Cities of the World, and a great amount of other information. In the center is a magnificent view of the Capitol at Washington, from Steel, and the flags of all Nations form a border. — 8. **Palestine and all Bible Lands.** — An excellent work, embracing on one sheet: Palestine on a large scale. 2. The Travels of the Apostle Paul, and the World as known to the Hebrews. 3. The Peninsula of Mt. Sinai, and the Route of the Israelites from Egypt to the Promised Land. 4. Plan of Jerusalem, Holy Places, etc. 5. A Chart of Seasons, Productions and other valuable matter. — The above Maps are of uniform size, the paper measuring 28 3/4 x 40 inches. They are handsomely mounted on rollers, ready for hanging, or they will be supplied in "pocket form" at same price. For one more subscription at \$1.50 (that is for three at \$1.50 each), we will send either of these Maps mounted on roller with cloth back. [Or, we will send any one of them post-paid, for \$1.00 each, or, with cloth back, \$1.50 each.]

**No. 299.—The new People's Map of the United States.**—From Messrs. H. H. LLOYD & Co. A new, Distinct, Accurate and Attractive Work, size 40x56 inches. This Map gives a clear view of the States and Territories of "our Great Republic," its Railroad System, and the principal Cities and Towns. It is adorned with views, from steel, of the Capitol at Washington, Mount Vernon, Washington from the Monument, and New York. Also a Map of the World, globular form. On the reverse side are maps of The World on Mercator's Projection, Europe, North America, and Palestine. Also the Census of the United States for 1870, by Counties, Population of Principal Cities, and a list of Remarkable Discoveries and Inventions, forming, altogether, an exceedingly useful and attractive Work.—Price \$2.75. It will be sent by us, post-paid, for *Four* subscriptions at \$1.50 each. [Or we will supply one, post-paid, on receipt of the price, \$2.75.]

one in gold case, for the watch chain, is offered in No. 4.

**No. 300.—Pocket Compass.**

Made of brass, open faced, glass covered, with jewel balance. Very useful, and can be easily carried in a pocket. Sent post-paid, for *Two* subscriptions, at \$1.50 each, [or for price, \$1.25.] From HODKINS & HAIGH, 298 Broadway, N. Y. (A pocket instrument to quickly give the points of compass at all times is very convenient. A very pretty

Premium 306

Premiums 307 & 308

Premium No. 318

**No. 317.—Long Range Creedmoor Rifles** (Remington's) used by most of the successful competitors at International, State, and other rifle contests. A great desideratum for shooting one-third to five-eighths of a mile or more, at game or otherwise. It is supplied with *Vernier Sight, Wind Gauge, and Spirit Level*, and "pistol grip" stock. This is the same gun, or improved if possible, that cost us \$108 not long ago. We will now present it for 75 subscribers at \$1.50 each, or supply it for \$80.00. Carriage to be paid by receiver.

**No. 318.—Frontier Repeating Rifle**, carrying 9 cartridges, of Government size (45-100 calibre, 70 grains powder), in tube under barrel. A simple quick motion with the knob, *k*, throws out the fired shell, and brings in a loaded cartridge ready for firing. The entire 9 shots can easily be made in less than half a minute, and another 9 cartridges can be put in ready for firing, in 10 or 15 seconds. Plain Walnut stock, with swivels for slings. Length of barrel, 24 inches. Plain open sights. Price \$22.00, or presented for 24 subscriptions at \$1.50 each. Same gun, with Combination Peep and Open Rear Sight, with Beach Front Sight, \$27.00. Presented for 29 subscriptions, at \$1.50 each. Expressage paid by receiver.—N. B. Those desiring a longer barrel can have the Army Rifle, barrel 32½ inches long. Other items, as calibre, 9 cartridges, prices, etc., the same as the Frontier Rifle.

**No. 319.—Sporting and Hunting Rifle—Breech-Loader** (Remington's).—Sporting stock, plain open sights; 26-inch barrel, using 38 or 44 calibre rim fire. Supplied at the price, \$30; or presented for 30 subscribers at \$1.50 each. Carriage paid by receiver.

**No. 320.—Sporting and Target Rifle—Breech-Loading** (Remington's).—24-inch barrel, 22, 32 or 38 calibre; weight from 5 to 6 pounds. Supplied at the price, \$20. Or it will be presented for 20 subscriptions at \$1.50 each. Carriage to be paid by recipient.

**No. 321.—Single-Barrel, Breech-Loader** (Remington's).—Sixteen gauge, *thirty-two-inch plain barrel*, weight 6½ pounds. Plainly made, but shoots just as well as the most costly carved and ornamented weapons. Can be loaded and fired 5 to 10 times a minute; cleaning-rod and loading-stick, accompany the gun. We will present this for 19 subscribers at \$1.50 each [or supply one for the price, \$18.00]. Carriage to be paid by receiver.

**No. 322.—Double-Barrel, Breech-Loading, Central Fire Shot Gun** (Remington's).—10 or 12 gauge, 28 or 30-inch barrel; weight, 8 to 8½ pounds. Decarbonized steel barrels, using paper or brass cartridges, that can be reloaded many times; two dozen of which, and reloader (costing \$3.00), and 500 primers, or caps (costing \$1), are given with the gun; one of the finest guns ever offered the American sportsman, combining all the most desirable features of the best imported, together with some valuable improvements not found with any other. Price of gun, \$40. Total, \$44.00. We will supply it at this price, or will present the whole for 40 subscriptions at \$1.50 each. Carriage paid by receiver.

**No. 323.—New Model Breech-Loading Duck Gun** (Remington's).—30 to 32-inch, 10 gauge, weight 9½ and 10 pounds, rebounding locks, top extension, rib fastening, walnut stock, decarbonized steel barrels. Supplied for the price, \$50. Or presented for 45 subscribers at \$1.50 each. Carriage paid by receiver.

#### No. 324.—A Cane Gun (or Gun Cane).

—This is a remarkably convenient and *effective* weapon, which, when not in use, has all the appearance of a fine chony, or hard-rubber Cane, and yet it can, in an instant, be changed to a Rifle (or Shot gun) which shoots accurately and to a long distance as a rifle of 32-100 calibre (or 22-100 when preferred). The writer recently carried one many thousand miles, simply tied with an umbrella by means of a rubber strap. It attracted no attention save when explained, and then it excited the admiration of all who saw it. On one occasion a hawk was shot from the top of a tree over 80 feet high, and sundry small birds desired for preserving as specimens, were killed with the shot cartridges—a new device in which 65 No. 9 shot are packed in a peculiar cartridge that holds them together while in the barrel, and prevents their leading the grooving. The upper engraving shows the cane as it ordinarily appears—the head and covering

of polished black rubber. The lower engraving shows one end only. A small sight, at the lower end is shown in the upper cut. The Cartridge (at *c*) is put in by opening the cane—it uses the ordinary long or short "22," or the shot cartridge. With a "long 32" cartridge we have pierced five pine boards, each one inch thick.—It is entirely safe. To use it, a quick vigorous pull opens the cane at *c*, the rear sight *s* flies up, and the two sights being far apart, pretty accurate range is obtained. Depressing the small trigger (*a*) fires the charge, but only when specially set for firing. A cork or plug in the lower end to keep out dirt, fits the cane for a good walking stick. The 32-100 size weighs 29 ounces; diameter of cane ¾ths of inch. The 22-100 size weighs 18 ounces. We prefer the larger size, but either size is supplied at the same price (\$10). It is thoroughly made by the Remington Works, and is supplied to us by A. ALFORD, 281 Broadway, New York. Ours has been fired some 400 times, or more, and is in perfect order. For lightness as a cane, and for mere target practice, the 32-100 calibre answers; we prefer the 32-100 calibre for most effective shooting. We will present one of either calibre desired, in return for only 12 subscriptions, at \$1.50 each. [Or send one on receipt of \$10]. Expressage to be paid by recipient. The *ball* cartridges can be obtained anywhere. The *shot* cartridges are a new invention, as yet only made 22-100, 32-100, and 38-100, and are not yet generally obtainable. They cost about 85 cents per box of 50, at retail. We will send one box of these (32-100) for each additional subscriber at \$1.50, or send, with the gun, one or more boxes at 50 cents per box, when desired.

**No. 325.—Revolver, Iroquois** (Remington's).—Nickel-plated, seven shooter, steel barrel and cylinder, 22 calibre; weight, 7 ounces. Sent post-paid for \$2.50, or presented for 4 subscriptions at \$1.50 each, and sent post-paid. The best Revolver ever offered for \$2.50.

**No. 326.—Revolver. —(The Southern).**—A very effective new Pistol: 32 Calibre, Five-Shooter, long Fluted Cylinder. Cylinder and Barrel best Cast Steel. Weight, 10 ounces. We present it for only 4 subscribers at \$1.50 each, and mail it post-paid, for 12 cents extra. [Or, we will send it post-paid for \$3.00].

**No. 327.—Remington No. 2 Revolver** (Smoot's patent).—Full plated, five shooter, three-inch barrel, 6½ inches long, using 32 calibre cartridge. Mailed post-paid for \$8.00; or presented and sent post-paid for 10 subscribers at \$1.50 each.

**No. 328.—Improved Army Revolver** (Remington's).—Central fire, six shots, 8-inch barrel, 13¼ inches long, 44 calibre; weight, 2 pounds. Loaded and shells thrown out without removing cylinder. Sent post-paid for the price, \$18; or presented for 19 subscriptions at \$1.50 each.—Sent post-paid.

Premium No. 317

**No. 329.—Cartridge Bag.**—Made of heavy water-proof canvas, and will hold 70 rounds. From THOMSON & SONS, 301 Broadway, N. Y. Presented for two subscriptions at \$1.50 each, [or we will supply one of them for the price, \$1.50.] Expressage paid by recipient. If to go by Mail, send 25 cents to pay postage & packing

**No. 330.—Whitman's Halter-Bridle.**—Col. R. F. WHITMAN, late of the U. S. Cavalry, has invented a Halter-Bridle, that is commended by those who are familiar with the wants of such as ride horseback for business or pleasure. The accompanying engraving represents the Halter-Bridle ready for use. The bit is fastened to the lower rings in the head-stall, by snaps, which enable it to be detached in a second, leaving the horses mouth free to feed, yet secured to any hitching place by the halter-rein, as shown above. These Bridles are made of the best material, and are well worth the money asked for them. They have been adopted by the U. S. Army in General Orders, and are now "regulation." To enable our readers to secure this Bridle, we will, on the receipt of *Seven* subscriptions at \$1.50 each, forward one of them by express [or, will supply one for \$5], the receiver in either case, to pay expressage.

**No. 331.—Whitman's Patent Bit.**—The accompanying engraving represents one of Col. R. F. WHITMAN'S improved riding bits. It is made of iron, with steel spring

snaps, and heavily covered with tin. It can be used in any bridle, or five-ringed halter, and is admirably adapted for use about a farmer's stable. We will present two of these bits on receipt of *Two* subscriptions at \$1.50 each. [Or, will furnish one for 75c, post-paid]. If parties prefer, they can have their choice between a riding bit as above, or a loose-ring driving bit of same make, and same price. These have been adopted by the U. S. Army Board.

13 Doane St., Boston, Mass.

**CORN SHELLERS** Superior to  
any in the  
Market.

**Hay Cutters** A. B. CONU,  
197 Water St., N.Y.

**SEDGWICK BROS.,**

**STEEL WIRE FENCE.**

Is the only general purpose wire fence in use. Being a strong net-work without bars, it will turn dogs, pigs, poultry, as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks, or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every respect, and far better than barbed wire. We ask for it a fair trial, knowing it will wear itself into favor. The Sedgwick gates, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength, and durability. Ask hardware dealers, or for price list and particulars address

SEDGWICK BROS., Richmond, Ind.

**RAGAN'S  
POWER  
CIDER PRESS**

— ALSO —

**Grater, \$35.**

Send for Circulars.  
EWALD OVER,  
Indianapolis, Ind.

**The "Centennial" Fanning Mill.**

The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover, and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers.

STEPHEN FREEMAN & SON,  
Racine, Wis.

**Lewis's Combination Force Pump.**

The above cut represents the three machines embraced in Lewis's Combination Force Pump. It is the most powerful and easiest working pump in the market. You get the three machines combined worth at least \$10, for \$5 for brass or \$7 for nickel-plated. They sell at sight. I will send a sample Pump, expressage paid, to any express station in the United States or Canada on receipt of price. I do this for a limited period only, to introduce the Pumps rapidly. Weight, 4½ lbs., length, 32 inches. The Pump will throw a good-sized stream from 50 to 60 feet. An ever-ready household fire-engine. I also manufacture the center machine, or "LEWIS'S IMPROVED POTATO-BUG EXTERMINATOR" and "AGRICULTURAL SYRINGE" separate. Price, zinc tube, \$1.25. Polished brass, \$1.75. Sample sent post-paid on receipt of price. NEW IMPROVEMENTS FOR 1880—10,000 SOLD IN FIVE MONTHS. As a Potato-Bug Exterminator I challenge the world for its equal in the saving of time, labor and material. A slight tap on handle discharges 3,000 to 5,000 fine drops on each hill. For syringing fruit trees infested with canker worm or other insects it has no equal. Agents wanted everywhere for these goods. My agents are making from \$10 to \$20 per day. Send for large Illustrated Descriptive Circular, Testimonials and Terms to Agents to

P. C. LEWIS, Catskill, N. Y.

**Kelly Steel Barb Wire.**

IS FREE FROM LITIGATION.  
Patented in 1868, and licensed under all first Patents.  
A FENCE FOR A LIFETIME.

Has No Superior, and Admits No Equal.

The Kelly diamond-shape Steel Barb is placed on the wire without loss of metal, leaves no room for moisture to rust the wire, retains its sharp points, and saves fully 10 per cent in weight per rod.

**BUY NO OTHER.**

If your Merchant don't keep it, send direct to Manufacturers. Send for Catalogue.

**THORN WIRE HEDGE COMPANY,  
CHICAGO, ILL.**

Stock-Proof,  
Storm-Proof,  
Fire-Proof.  
Weight only  
One Pound  
to the Rod.

**FRENCH TRESS.**

**Steel Wire  
Barb Fence**

Patented Dec. 14, 1875.

Re-issued May 21, 1877.

**The Best and Most Durable  
of All Barb Wire in Use.**

A sure protection, cheaper than board or rail fence, and good for a lifetime. Wastes no ground. Has no weedy fence row. When the best costs no more than an inferior article, always look for the best. We claim for the French Tress a Superiority over all other Wires. For Circulars and Price Lists address

ST. LOUIS WIRE FENCE CO.,  
814 & 816 N. 2d St., St. Louis, Mo.

## Pennsylvania Lawn Mower,

Surpassing all others and pronounced the best, lightest, runs more easily, cuts longer grass, is more durable, requires less repair, cuts grass more smoothly, is less liable to obstruction, is of handsome appearance.

Penn. State Agricultural Society says, "It will, we believe, wear longer, do the work better with less labor than any other Mower. One of the peculiarities is that it will cut higher grass than any other Mower."

Every machine warranted. Address  
**LLOYD, SUPPLEE & WALTON, Philadelphia, Pa.**

## Pearce's Improved Caloon Broadcast

### Seed Sower

Sows all kinds of Grain and Grass Seed.

This machine has been sold in every State in this country, and in almost every Grain growing section on the Globe, giving entire satisfaction everywhere to every intelligent operator. Price \$6.00. Does the work of 5 men.

**GOODELL COMPANY,**

Antrim, N. H.,

SOLE MANUFACT. RERS.

## MEDAL MACHINES.

New York State Agricultural Works.

### First Premiums at all Competitive Trials.

Best in the Market for Home or Export Trade. Eagle Horse or Hand Dump, Ithaca, and Centennial Steel Tooth Horse Rakes, acknowledged to be three of the best in the field. More than 100,000 in use, at home and abroad.

## La Dows Jointed Pulverizing & Smoothing DISC HARROW.

Being jointed in the center, is adapted to both smooth and uneven surfaces. Acknowledged the best of the kind, and will pulverize and cover seed better in one operation, than going over twice with others. Made with both Chilled Metal and Cast Steel Discs polished. Send for circular and price list. Manufactured by

**WHEELER & MELICK CO.,**

Albany, N. Y., for the United States.

## THE PLANET JR. GOODS.

We are sure, that very many Farmers and Gardeners imagine the finely finished tools we offer in our Illustrated Catalogue, are of little use or importance to them; but this is a great mistake, and we ask every one to examine for himself their real value. Let every man, woman and child, whether interested much or little in working the soil, send now for our carefully written catalogue, and decide for themselves whether they can afford to do without the aid of one or more of our inventions. We want Farmers who grow anything that has to be either planted or cultivated, to study out our Combined Horse Hoe, Cultivator, and Coverer; Market Gardeners who have acres upon acres, on each of which our Double Wheel Hoe will save its cost yearly, to examine the merits of our fine garden tools; and every one who has even a small family vegetable garden, to read closely just what the Firefly Hoe and Garden Plow will save them in time, labor, and money. Our catalogue is free to all, and we want all cultivators of the soil to read and be convinced that we do not make a single tool as a plaything to be bought only by the rich, but that every one of them is a practical all-day tool, made expressly to save the time and labor of the hard-worked tillers of the soil.

**S. L. ALLEN & CO., Manufacturers of Agr'l Tools, 229 Market St., Phila., Pa.**

## COMPLETE GIST MILLS FOR FLOUR & MEAL.

AWARDED

ESTABLISHED 1851.

### First Premium

Best material used, and every Churn and Butter Worker warranted exactly as represented. One Churn at wholesale where we have no agent. Send Postal for Circulars.  
**AGENTS WANTED.**

**CORNISH & CURTIS, Fort Atkinson, Wis.**

## \$250—CHALLENGE—\$250

I will pay above amount for any Butter Color that will excel my manufacture in the following points:—It has no taste or smell, and is as harmless as water. It is liquid, is easy to handle, and is mixed in the cream before churning. Produces a color resembling golden June grass butter. It is the only article that will color the butter and not the buttermilk. It gathers all the butter materials, and increases the weight more than enough to pay for the color used. The color of the butter never changes. In short, it is decidedly the best article for the purpose ever offered for sale. **Mrs. B. SMITH, 533 Chestnut St., Philadelphia, Pa.**

**AGENTS WANTED** Everywhere, to sell the **Best Family Knitting Machine** ever invented. Will knit a pair of Stockings, with heel and toe complete, in 20 Minutes. Will also knit a great variety of fancy articles, for which there is always a ready market. Send for Circular and Terms to **The Twombly Knitting Machine Co., 409 WASHINGTON STREET, BOSTON, MASS.**

## THE FERGUSON BUREAU CREAMERY.

Surpasses all others in quantity and quality of butter made. It secures matured and ripened cream, which makes butter of the best texture, flavor, and of unequalled keeping quality. It excludes flies, dust and all odors; is constantly at the correct temperature (53° to 60°); has room for the cream and butter, and saves three-fourths the labor. It can be used with either ice or water, and both summer and winter. **THE FERGUSON CONCUSSION CHURN** is the best. It combines scientific principles with the best labor-saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Before buying any other Churn or Creamer, or any pans, or cans, send for large illustrated circular to **THE FERGUSON MFG CO., Burlington, Vt.** Reliable Agents Wanted.

**BLOODED STOCK!**  
 Thoroughbred Cattle, Sheep, Hogs, Fancy Poultry, Sporting and Farm Dogs, all bred from the choicest imported and prize-winning strains and for sale at fair prices. ## Maynard's Rifles and Shot-Guns.

## Our New Off-Hand Rifle.

For hunting and target practice, at all ranges, the "MAYNARD" more completely supplies the wants of hunters and sportsmen generally, than any other rifle in the world, as many barrels can be used on one stock; and for ACCURACY, CONVENIENCE, DURABILITY, and SAFETY, is not excelled. The following are some of the scores recently made at Walnut Hill, by members of the Massachusetts Rifle Association: J. N. Frye, President, in All-Comers' Match, 15 shots, 300 yards, without cleaning, 54555555-45-71; L. L. Hubbard, Executive Officer, 300 yards, off-hand, 45555555-48; O. M. Jewell, 300 yards, off-hand, 5455555-84; O. M. Jewell, 300 yards, off-hand, 5555555-35. For illustrated price list, address

A. I. ROOT, Medina, Ohio.

# LANDRETHS' GARDEN SEEDS

ARE THE PRODUCE OF OUR FARMS SITUATED AT

BRISTOL, Bucks County, Penna., BURLINGTON, Burlington County, N. J.,  
MANITOWOC, Manitowoc Co., Wis., MONASKON, Lancaster Co., Va.,

the whole comprising a total of 1574 ACRES owned, occupied, and cultivated by ourselves. Upon these lands we have applied in a single season \$20,000 worth of purchased fertilizers, a fact which exhibits the magnitude of our operations.

## THE STOCK SEEDS

from which all our crops are grown on all the farms, are produced on **Bloomsdale**, the Pennsylvania farm, and under the daily scrutiny of the proprietors, are thoroughly culled of all departures from the true types, and produce crops of such purity of strain as to warrant us in declaring that *none are Superior and few Equal!* Varied soils and climates, systems of cultivation, drying houses, steam machinery, implements and appurtenances generally, demonstrate our ability to produce large stocks of seeds upon the most favorable terms.

## DAVID LANDRETH & SONS,

Nos. 21 and 23 S. SIXTH Street, BETWEEN MARKET and CHESTNUT STREETS, PHILADELPHIA, Pa.

Illustrated catalogue free upon application.

## IOWA BARB FENCE COMPANY, Limited,

93 JOHN ST., NEW YORK, and JOHNSTOWN, PA.

MANUFACTURERS OF BURNELL'S PATENT  
**FOUR-POINTED BARB STEEL WIRE FENCING,**  
Galvanized and Painted. Also, Staples, Diggers,  
Stretchers, Wire Cutters, Iron Posts, etc.

Patented June 19, 1877.

Shows the exact size of our wire and barbs, except that the barbs are 6 inches apart and not 8 1/2, as shown in cut. One pound measures 15 feet in length.

Shows our wire put up on spools, ready for shipment. Dimensions of spool, about 18 x 20 x 22, measuring about 4 1/2 cubic feet; weight, about 100 pounds, and length of wire, about 1500 feet.

Made of two strands of No. 12 Steel Wire, twisted together just enough to allow for the contraction and expansion of the metal, caused by the difference in temperature, and still not so much as to injure the structure of the steel.

The Barbs on our wire are **FOUR POINTED**, thus always presenting a Barb laterally or at a right angle, which is a **GREAT ADVANTAGE** over the two-barb wires, as cattle are unable to get against the fence to break it or push it down.

The Barbs are fastened to the wire (at intervals of six inches) in a manner entirely different from any other, being securely locked **AROUND** and **BETWEEN** both wires, so that they can not slip or move toward each other, and they also prevent the untwisting of the cable should either wire get broken.

The use of Barbed Wire for fencing is no longer an experiment, but is an acknowledged necessity, as over **ONE HUNDRED THOUSAND MILES** of it were put up last year, and we confidently expect twice the quantity will be used this year, as there is no other material anywhere near as cheap, as lasting, or effective.

A thousand pounds of our Wire makes a mile of fence of three strands, at a cost of only 50 to 75c. a rod.

FARMERS NEED NOT FEAR INJURY TO STOCK. IT IS IN UNIVERSAL USE THROUGHOUT ALL STOCK RAISING DISTRICTS.

Samples, Circulars, etc., sent by mail to any part of the world.

CORRESPONDENCE INVITED.

## WANTED AGENTS

For the fastest selling book of the age:

## The HOUSEHOLD and FARMERS CYCLOPEDIA

Every farmer needs it. **How to Farm Profitably.** Live Stock and Domestic Animals, Diseases and Remedies. How Bred and Raised. Your own Lawyer and Doctor. Building, Cooking, Dyeing, and other useful knowledge. Published in German also. Send for circulars to

## "ACME" PULVERIZING HARROW, CLOD CRUSHER & LEVELER.

Especially adapted to sod and hard clay where other Harrows utterly fail. The best tool in the world for preparing land for winter grain. Highly recommended by the Editor of the *American Agriculturist*. See March number, pages 84, 96 and 122. **NASH & BRO.** Sole Manufacturers. Harrisburg, Pa., and 22 College Place, N. Y.

## BOLSTER SPRINGS FOR FARM WAGONS.

Made of Best Oil Tempered Steel.  
**SOMETHING NEW!**

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over three years, and are a pronounced success. No Teamster or Farmer can afford to be without them.

We want Agents everywhere. Send for description and price, and mention this paper.

W. S. BLUNT'S

**Universal Force Pumps.**

Secured by letters patent.

THESE PUMPS HAVE RECEIVED THE "MEDAL OF SUPERIORITY." The highest award of the American Institute for 1878 over all competitors.

These pumps have enormous power, and are for the house or for out-door wells of any depth. They are constructed with special regard to strength, ease of working, and durability. They can be immediately changed from lift to force pumps, and the air chamber can be re-vented, so as to allow the handle to work at any desired angle with the spout. Having close tops, they cannot be tampered with. Attention is called to our new elegant pattern **DEEP WELL non-freezing FIRE PUMP.** Also, Blunt's Sand Vacuum Chambers. A complete protection against sand or gritty water in dug or driven wells, pits, mines, and rivers. For hand or steam pumps, all sizes, from 1½-inch to 4-inch suction pipe.

Send for circulars to

AT WHOLESALE FACTORY PRICES.

FIFTEEN  
DAYS  
Test Trial.

A 13 Stop Organ  
ONLY  
**\$95**  
With Stool.

**PATTERSON ORGAN** The PARAGON Style No. 440. Three sets Reeds, 5 Octaves, 13 Stops. Dimensions: Height, 74 in.; Width, 48 in.; Depth, 24 in. Improved Knee Swell and Grand Organ Knee Swell. The style of this Organ is beautiful and unique, and combines elegance of Design, just proportion, and beautiful finish. The case is of solid Black Walnut, tastefully ornamented with handsome Mottled French Walnut Panels, which being highly finished, contrast admirably with Dark Walnut of Case. The tone is remarkable for purity and sweetness, combined with volume, variety and brilliancy. The touch is quick, responsive and pliant, and, in fact, the whole instrument, in action and case, has every requisite of the most perfect Parlor Organ. No better organ can be purchased for family use. You pay for instrument only after you have fully tested it at your own home 15 days. If not as represented, return it at my expense, I paying freight both ways. Each instrument boxed and delivered on cars here for only \$95. Fully warranted for 6 years. Remember this offer is at my lowest Net Cash wholesale Factory price, therefore no reductions can be made. Order at once from this advertisement, giving as reference any responsible Banker or Business Firm.

# New Music Books!

**The Anthem Harp.** (\$1.25.) By Dr. W. O. PERKINS. (Just out.)

A new book intended as a successor for "Perkins' Anthem Book," published some years since, and which was a decided success. The new book contains music perfectly within the reach of common choirs, and is destined to have a great sale.

DITSON & CO. also call attention to their three books for SINGING CLASSES; recently published, already very popular, and worthy of universal adoption:

**The Temple.** (\$1.00.) By Dr. W. O. PERKINS.

**The Voice of Worship.** (\$1.00.) By L. O. EMERSON.

**Johnson's Method for Singing Classes.** (60 cents.) By A. N. JOHNSON.

The Temple contains an excellent Singing School Course, and a large number of Glee, Songs, Sacred Tunes and Anthems for practice, and for use in classes. L. O. Emerson's *Voice of Worship* has exactly the same end in view as the other, but has a different method, and entirely different music. *Johnson's Method* is for those who wish a low-priced book; is admirably simple and clear, has plenty of music, and has a thorough course in Note Reading.

Any book mailed for retail price.

### SUBSCRIPTION TERMS.

(English and German Edition at same Rates.)

For One or Two Subscriptions. One Year, the price will hereafter be (post-free) **\$1.50** each, instead of \$1.60.

[ALL POST FREE.]

Three Subscribers one year.....\$4, or \$1.33 each.  
Four Subscribers one year.....\$5, or \$1.25 each.  
Five Subscribers one year.....\$6, or \$1.20 each.  
Six Subscribers one year.....\$7, or \$1.17 each.  
Seven Subscribers one year.....\$8, or \$1.14 each.  
Eight Subscribers one year.....\$9, or \$1.12 each.

When or more Subscribers, post-free,  
Only \$1 each.

A free copy to sender of club of 20 at \$1 each.]

Single Numbers sent, postpaid, for 15 cents each. Specimen numbers for examination sent, postpaid, for 10 cents each. Subscriptions can begin at any time.

The Above Terms are for the United States and Territories, and British America. Add 14 cents extra per year for papers sent outside of the United States and British America, except to British Honduras. For the last named country the extra charge is 38 cts. per year, to cover extra postage, and Single Numbers, 17 cents, post-paid. Remittances, payable to Order of Orange Judd Company, may be sent in form of Checks or Drafts on N. Y. City Banks or Bankers; or P. O. Money Orders; or in Registered Letters, such letters to have the money enclosed in the presence of the Postmaster, and his receipt taken for it, and the postage and registering to be put on in stamps. Money remitted in any one of the above three methods is safe against loss. Bound Volumes from Vol. 16 to 38 inclusive, supplied at \$2 each, or \$2.30 if to be sent by mail. Sets of numbers sent to the office will be bound in our regular style for 75 cents (30 cents extra if to be returned by mail). Missing numbers in such volumes supplied at 10 cents each. Any Numbers of the paper issued for 23 years past, sent post paid for 15 cents each; or any full year, sent unbound, for \$1.50. Clubs of Subscribers can be increased at any time, at the club rates. If new members begin at same date as the original club.

## Wood Sole Shoes,

Wear three times as long as leather-soled shoes. Keep the feet perfectly dry and warm, are easy to the feet, being shaped to suit the action in walking. Particularly adapted to Miners, Farmers, Butchers, Dyers, and all laborers.  
**CHAS. W. COPELAND,**  
Sole Manufacturer,  
BOSTON, MASS.

Send Stamp for Circular and Price List.

**B. W. PAYNE & SONS, CORNING, N. Y.**

ESTABLISHED 1840.  
Patent Spark-Arresting Engines, mounted and on skids. Vertical Engines with wrot boilers. Eureka Safety powers with Sectional boilers—**can't be exploded.** All with Automatic Cut-Offs. From \$150 to \$2,000. Send for Circular. State where you saw this.

VOLUME XXXIX.—No. 10.

NEW YORK, OCTOBER, 1880.

NEW SERIES—No. 405.

THE POLLED ANGUS BULL "JUDGE," (1150).—Drawn and Engraved for the American Agriculturist.

The fine bull "Judge," now five years old, was recently purchased of his breeder and successful exhibitor, Sir George Macpherson Grant, Bart., M.P., of Ballindalloch, Strathspey, Scotland, for the Whitfield Model Farm at Rongeuant, Parish of St. Cesaire, County of Ronville, Province of Quebec, Canada. He is one of the most famous prize-winners of his breed in the world, having crowned a very unusual list of winnings at Scotch shows in the years 1876 and 1877, by winning the first prize and gold medal at the Paris International Exposition in 1878 as a three-year-old Angus, or Aberdeen bull. His pedigree includes several of the most famous of the foundation stock of this remarkable beef breed, now growing so rapidly in favor on both sides of the Atlantic. With him are imported a number of excellent cows of his own breed—the Angus, or Aberdeen—and both males and females of the Hereford, Ayrshire, Galloway, West Highland, and Shetland breeds, all bought by Mr. Whitfield and destined for his model farm, at which herds of Shorthorns, Devons, Ayrshires, Jerseys, and Kerrys, are already established. We

are informed that this varied stock has been selected with great care, and with a view to secure the best possible representation of the respective breeds. The Galloways, West Highlands, and Shetlands, have been rarely seen in this country; the last-named never before, so far as we know.

The above portrait is from a photograph taken at the time of the Paris Exposition of 1878. "Judge" has since that time altered somewhat in form, as would be expected, having become broader, deeper, and more massive, with no loss of the nearly perfect symmetry represented in the engraving. His pedigree in the line of dams, is as follows:

"Judge" (1150), bred by Sir George Macpherson Grant, dropped February 7th, 1875; sire, "Scotsman" (474), by "Jim Crow 3d" (350).  
Dam "Jilt" (973), by "Black Prince" (366).  
Gr. dam "Beauty" (1180), by "Young Jock" (4).  
G. gr. dam "Favorite" by "Gray-breasted Jock" (2).

The attention of the readers of the *American Agriculturist* has been repeatedly directed to this fine breed. The advantage which they offer to shippers of live beef in having no horns is of itself

of great importance, but when we consider that they hold their own with the best families of the Shorthorn breed, which they rival in size, as economical beef producers and quick feeders, it seems certain that they are soon to become the favorite breed for the chief beef-producing regions of this country, especially for the Great Plains and Texas. A few years ago the experiment was fairly tried by the introduction of a fine bull or two of this breed in Central Kansas, and all who have handled his progeny are anxious for more, and are taking steps to procure them. Half-bred bulls impress their characteristics strongly, and few horns appear on either sex before the third generation. Of course in herding and handling in droves, they are not dangerous to horses or men, even should they inherit the disposition of the Texan cattle, which have a reputation for fierceness. The improved beef-breeds are all docile, gentle, and easily handled, and the Angus particularly. They are by no means defenseless, as some might think; but with the poll-knob, which is largely developed, they strike terrible blows and make a good fight if necessary.

**Nitrification**, or the formation of available compounds of nitrogen is now generally thought, by scientific men, to be due to the action of a living organism—a minute fungus—and the process is a fermentation like that which is caused by the yeast plant.

## AMERICAN AGRICULTURIST.

NEW YORK, OCTOBER, 1880.

## Hints for the Work of the Month.

[The Hints and Suggestions in these columns are never copied from previous years, but are freshly prepared for every month, from the latest experience and observations, by practical men in each department.]

**Grass** is our most important crop, and it is essential to its best condition next spring and summer that it be well wintered. The roots are benefited by the thick mulch of late autumn growth. Therefore do not feed off the meadows which it is intended to mow next year, but rather top-dress with a fine compost, which may be largely composed of swamp muck treated with lime slaked with brine.

**Weeds in Grass Land** may be very easily seen and destroyed this month by the use of the "spud," a broad chisel-blade attached to a handle like that of a spade or long-handled shovel, having a spur upon it for the foot to aid in thrusting it into the ground. A boy with an instrument of this kind can rapidly clear grass land of buttercups, daisies, and a multitude of other biennial and perennial weeds.

**Grass Seed** may be sown upon spots in both pastures and meadows where the stand is not good, and if harrowed over with a dressing of manure or some "fertilizer," will often work a complete renewal of the grass.

**Winter Grain.**—It is not too late to sow wheat or rye, see "Hints" for last month. More seed is uniformly required for late sowing, because the young plants will not tiller so much—that is, throw out so many shoots which will form flower-stalks and heads in the spring. To prevent smut, use a pickle of four ounces of blue vitriol, or "blue stone," to a gallon of water; when dissolved, use half a gallon to the bushel of wheat, sprinkling it over the heap on a barn-floor and stirring until every grain is wetted, then dry by sifting quicklime over the heap and shoveling it over.

**Top-dressing.**—Bone dust or "tankings," or some fertilizer in which the nitrogen is not in the form of ammonia, and not soluble, is the best for late autumn application to grass or grain. Such a manure has some immediate effect, yet is not washed away in solution by heavy rains, but shows its potency in the spring.

**Potatoes.**—The sooner they are dug now the bet-

ter. It is best to keep them a while either in protected heaps in the field, or on some unused floor. They throw off much moisture within a few days, and will heat if in large heaps or too deep in the bins. When thoroughly dry, they may be placed in secure pits or in the cellar. Potatoes are injured at once by frost, and gradually by sunlight, or even by diffused light. They should, therefore, be kept from the light as much as possible, and decayed ones carefully culled out before they are put away.

**Roots** are now making their best growth. Moderately warm days and cold nights seem to have a great effect upon them. As the time for heavy frosts approaches, secure the mangels and sugar-beets. Top by rubbing the leaves off, not by cutting, as the wound often starts decay, which spoils the beet. Carrots secure attention next after the beets, and turnips next, leaving the Swedish turnips longest. Always protect piles of roots against frost by some covering. Turnips will survive severe freezing, but they are never so good for feeding.

**Corn.**—There is probably little corn left standing in the region where early frosts prevail, yet after the middle of September, when a cold wave, with two or three frosty nights, passes over the Northern States, we often have a long "spell" of pleasant weather, and if corn has escaped it may still be cut, and the fodder will be good. This is, however, exactly the weather for husking, if other more pressing work is finished. If there is a market for husks, the ears may be picked and the husking done in the barn; but otherwise the husking must be done in the field, and it is poor policy to wait after the stalks are dry and the soft ears pretty well hardened. In fields where most of the stalks have two ears, and there are none without ears and they are large, a man will sometimes husk 100 bushes of ears a day, and now and then a "champion" husker will husk the corn on an acre of ground yielding 80 bushels of shelled corn or over, but other hands must bind his stalks.

**Corn Fodder**, by which we mean the stalks after husking (not the leaves of the corn merely stripped off), should be bound in bundles, probably best done with willow withes, and stooked up so as to shed rain. Large stooks, well set and firmly bound may be left in the field until needed for feeding, without injury to the fodder. In fact, it is often brighter and better when treated in this way than in any other. In stacks, or in sheds, it is likely to heat and mould, unless it can be more thoroughly dried than we can be sure of having it.

**Fodder Corn**, which, of course, was cut before the first frost, or much of its value was lost, should be handled much in the same way. As soon as the stalks are sufficiently dry, and the weather so cool that danger from moulding is past, put it up in small bundles, and set these together in large stooks in the field, bound securely at the top.

**Seed Corn.**—The selections of seed corn, though usually made this month, ought to be done about September first, for then one going among the standing corn can select the ears likely to produce corn most to his liking, much better than after the corn is cut up. It is best to have reference to earliness of maturity, size of stalk, ability to stand up, the number of brace roots, and the amount of leaf, as well as to the size of the ears, and the number upon a stalk. But one who is "breeding" corn should look farther; the shape of the ear is important; the butt should be small for convenience of husking, and the cob small and well covered; the rows of kernels perfectly even, and the husks long enough to protect the grain from the sight of birds, which are often tempted by the sight of the corn to do a good deal of damage. Every farmer who selects his own seed corn with care, will, in a few years, find that he has a variety of his own breeding quite different from the corn of his neighbors, and which ought to be a decided improvement on the original stock. At husking time we can only select ears, but when the selection is made among standing corn, the best plan is to tie a cord around the selected ones near the tip, so as to prevent the huskers stripping off the husks. They will then throw the tied ears aside, and they

may be gathered, husked, and sorted according to their perfection at leisure, braided together, and hung up in a dry loft, or in the peak of the corn crib.

**Corn Crib.**—The only perfect protection of a small building against rats, is the setting it upon posts protected by tin, by broad caps, or in some such way. A corn floor is sometimes made in the peak of the barn roof, above the tie-beams, and resting upon them fully half the length of the rafters above the eaves. This is not, however, perfect protection, though it often remains for years before the rats find any way of getting to it; it is an excellent place to keep corn and seeds of all kinds. The grain must be hoisted by a horse with a block and tackle. Free ventilation is absolutely essential to the proper curing of the corn crop, hence corn cribs and bins have open, slatted sides, and, if exposed to storms, such a slant that the rain will not drive in. The old rail pen, narrower at the base than at the top, and well thatched, with straw or stalks, cures and keeps the corn as well as the most expensive corn house, and protects it quite securely from everything except vermin.

**Plowing for Spring Crops.**—This may be done at any time now, where the soil is not too light, and not likely to wash during the winter. The ground should be left rough to be subjected to the fullest action of the weather, freezing, thawing, wetting, drying, etc. Should a crop of weeds come up, it will very likely pay to harrow and plow again.

**Ridge Plowing** of stiff clays is often of great benefit. It is done by turning the furrows two and two together, so as to leave the land uniformly ridged. The ridges must run up and down the slopes; otherwise, in heavy rains, water will be held by the ridges until it breaks through somewhere, when there will be danger of a "wash-out." This system of winter fallowing involves plowing again in the spring, but shows its good effects in the crops.

**Water.**—If pure water does not flow at the barn, look into means for securing it. Barn-yard wells are convenient, but often dangerous to the health, if not of animals, certainly of men, who may drink at them. If the water from some spring can be led to the house and barn, by all means bring it down—use plain iron pipes or enamelled ones—not "galvanized" pipes. Zinc is a slow poison, but not quite so bad as lead. A well on higher ground will often furnish flowing water, conducted by a siphon, at the level of the buildings. No well should be dug at a less distance than 300 feet from a barn-yard, cesspool, or privy vault.

**Buildings.**—This month offers the most favorable time usually for the painting and repair of farm buildings, and putting them in order for the winter. A great part of this work may be well done during this month by the farmer and his boys.

**Implements,** put away for the winter, should be painted or protected in some way from the action of the air and moisture. Paint or varnish for the wood-work, and a varnish of two-thirds rosin and one-third mutton tallow is excellent for protecting iron and steel.

**Live Stock.**—A little extra feed brings cattle and horses to the beginning of winter in good order. The tops of carrots, beets, and turnips may be fed to good advantage, and there is a great deal of sweetness in the October pasturage. Where much corn is planted, there will always be soft ears and "nubbins" which are best fed to horses and pigs.

**Swine.**—Pigs will fatten nearly as fast on potatoes this month as on corn next. They do best on cooked feed, and the grain ought to be ground.

**Sheep.**—This month we speak for March lambs. Half-fed sheep are often run into market from sections where food is scarce, and it pays well to secure such to feed for the winter, turning them off fat in the spring. The feeder should be satisfied if, by so doing, he works up his wheat straw and corn into manure, getting pay for his grain and cash outlay, and that only.

**Poultry.**—Early fattened poultry bring more money if marketed in October, and early in November, than at Thanksgiving and Christmas time. They fatten much easier, also, at this time, for it is not so cold, and they get more forage in the fields.

## Notes on Orchard and Garden Work.

The present month may be said to close the season in the Orchard and Garden, and it offers an opportunity for looking back over the successes and failures of the busy growing months that are past. This is a time when the lesson to be drawn from the past may be a guide and an inspiration for the future. In the retrospect it may be found that the failure in one place was due to imperfect preparation of the soil; in another the soil was not good, and not infrequently the soil and the seed being of the best, the young plants were neglected and the crop was rank weeds instead of a paying one. The "bad luck" of the season may be due to imperfect drainage, and if so, the gardener should begin at once to remedy the difficulty. This is one of the best of the months for making drains, and having decided to improve the soil in this way, push the work in a thorough manner to completion. This is a favorable month for all labor requiring the removal of earth, and such work as the making of roads in the orchards, grading, etc., can be better done now than in the busy days of spring.

## Orchard and Nursery.

**Apples.**—The practice of picking the fruit and putting it in heaps for a few days until the skin toughens, before barrelling, is a good one. Put the fruit into the barrel with care, shaking it down when half full, and again when full, so that the apples will fit closely when the head is pressed in by means of the barrelling press. The opposite head should be marked as the one to be opened. This season of abundant apples it will not pay to market any except the best fruit, and that in fine shape. Dry second-rate fruit or make it into

**Cider.**—The best cider is made from late ripening, sound fruit, and in cool weather when the fermentation is gradual. Many early apples may be worked up into sweet cider and sold as such or made into vinegar. This is one of the best methods of turning to account fruit that would otherwise be lost.

**Vinegar.**—The essentials for good vinegar are: good cider; a temperature of at least 70°, and as complete exposure to the atmosphere as possible. The process may be hastened by adding yeast to the cider, or "mother" from old vinegar barrels, which amounts to the same thing. Vinegar making is therefore a sort of fermentation, facilitated by a low microscopic plant of the fungus group.

**Pomace** from the cider press is of no great value either as a food for stock or as a manure to the land. Pigs will eat it to some extent. It should be put in the manure heap, as when left by itself in the open air it gives off a disagreeable odor.

**Fruit Cellars** should be in readiness, but the fruit should be kept under sheds, etc., until cold weather comes, being careful to remove it to the cellar before being exposed to severe cold. The fruit cellars should be provided with ventilators so arranged that they can be readily thrown open.

**Heeling-In.**—When the orchardist purchases his young trees in the fall they should be heeled-in, which, when properly done, consists in burying the roots in a place where they will keep in good order until ready to set out in the spring. The usual method is to open a trench—lay the trees in a slanting position and fill with earth. If set upright the trees are more exposed to the weather; but are less apt to be injured by mice. No unfilled places should be left about the roots; finish off with patting the surface of the soil down firmly with the back of the spade. Look well to the labels, and leave no litter near the trenches to harbor mice.

**Sundry Matters.**—Recently planted trees should have a conical mound of earth around them to protect from mice and act as a stay for the tree against winds. Top-dress the orchard with fine manure. Repair fences and gates, put away the tools in good shape, and do the many odd jobs that will help so much when the busy days of spring come.

## The Fruit Garden.

Every farmer or owner of a good-sized village lot should have a separate plot of ground devoted

to small fruits. Now is a good time to decide upon this matter, and begin to have a Fruit Garden. The soil should be well drained, and if not rich, made so by an abundant supply of manure, which is best plowed under and the soil left rough until spring.

**Strawberries.**—If planting is done now it is pleasanter than in the spring, as the soil is in a better condition, besides it will relieve the pressure of spring work. There is no gain in the time of fruiting by planting now, unless the plants are pot-grown and are set out without any disturbance to the roots. When the ground begins to freeze the bed should be covered with litter, marsh hay, straw, etc., putting it only slightly over the plants, that they may not be smothered. In setting, fifteen inches between the rows will be the distance most suitable for working a narrow cultivator among the plants. Exercise care in selecting good sorts.

**Blackberries.**—It is best to set them in the fall, as they start so early in the spring, placing the plants 6 to 8 feet apart. The Snyder is coming into favor.

**Raspberries** should also be put out in the fall, for the same reason as for blackberries mentioned above. Set the plants in rows about 4 by 4 feet.

**Grapes.**—The grape-shears should be used in picking, as it allows the bunch to be cut without handling to deface the bloom. The Concord, and similar thin-skinned varieties will keep but a short time. The Catawba, Isabella, Diana, and other thick-skinned varieties may, with care in packing, be kept until midwinter. Grapes should be picked in shallow trays, and left in a cool room for a few days, for the skin to toughen, then pack in 3 to 5-pound boxes, filling from the bottom, and tacking it on with slight pressure. Label the opposite side which will be the one to be opened. The vines should be pruned so soon as the leaves have fallen.

## Kitchen and Market Garden.

The principal work of the month, in this department, will be caring for the crops that are stored, and preparing for the early spring crops. All rubbish should be cleared up and the ground manured and plowed to aid in the spring work.

**Cold Frames** should be made for cabbages, lettuce, etc. Light and dry soil in a sheltered place should be chosen. A rich soil is not demanded, as the plants are to be simply protected, not grown, during the winter. The object of cold frames is to protect plants that would otherwise be killed by the frequent changes of the weather—not to grow them. If the frames are to be used afterwards for growing plants, then a rich soil is required. A plank of about 12 inches wide makes the rear of the frame, and one 8 inches high does for the front, and far enough apart to hold the sashes by their ends. Two strips should pass from front to rear, where two sashes meet, for them to slide upon. The sashes should not be put on until the weather requires it. In the South, ridges of earth running east and west serve the same purpose, and take the place of cold frames in the colder regions of the northern States.

**Roots.**—Parsnips and Salsify improve by being frozen. Beets and carrots are injured, and should be dug before the freezing weather sets in. A supply for table use may be packed in dry earth, in boxes or barrels, and put in the cellar—the rest should go into the root-cellar or pits. The filling up of the cellar of the dwelling with various kinds of roots, fruits, etc., is objectionable, as foul gases are continually rising through the house and making the air impure.

**Pits** must be made where it is dry and water will not stand on the bottom. The most convenient form is a trench 3 or 4 feet deep, and 6 feet wide, and as long as needed. The roots may be put in sections with a cross wall of earth between each. In this way a portion of the roots may be taken out without disturbing the rest of the pit.

**Asparagus.**—The tops should be cut and burned, and a dressing of coarse manure applied to the bed.

**Beans.**—Lift the Limas, poles and all, at the first frost, and put them under a shed where they may be kept fresh for some time. The ripe pods should be gathered and shelled for winter use.

*Beets* should be dug before the frosts, and stored in pits. The tops may be fed to the cows.

*Cabbage*.—Gather before the frosts come, and put them in pits or trenches. Cabbages set with heads down and covered with earth, will keep well.

*Carrots*, like beets, should be dug before the frosts come, and stored in root-cellar or pits.

*Celery* not yet earthed up should be attended to. First bring the leaves together, and draw the earth to them with the hand, to hold them in an upright position. A portion for early use may be banked up now to the top of the leaf-stalks.

*Lettuce*.—Sow in cold frame for early spring use.

*Onions*.—If sown in the fall the young plants must be covered with litter to keep the frost from heaving them out of the ground.

*Parsnips*.—Dig enough for present use and store in the cellar, and leave the rest in the ground, where the frost will sweeten and improve them.

*Spinach*.—Thin as required for use, giving the plants to be wintered a plenty of room. Keep clean of weeds to insure a good crop.

*Squashes*.—Gather before the frost injures them, and handle carefully to avoid bruising. Use the least ripe first, and store the others in a cool place.

*Sweet Potatoes* should be dug so soon as the leaves are injured, and placed where it is warm and dry.

*Tomatoes*.—When danger from light frosts is apprehended, the season may be prolonged by protecting the plants, or some of them, by cloths or papers. Some pull up their vines and hang them up in sheds, etc., for the same purpose. Secure the green tomatoes in sufficient quantities for spiced and other pickles, before the frost injures them.

### Flower Garden and Lawn.

A mistake is made by many in ceasing to care for the Flower Garden as soon as the first frosts come, as they thereby deprive themselves of some weeks of enjoyment. In the climate of New York City, late September or early October usually brings frosts that are heavy enough to demoralize the Coleuses, and like tender plants, while the more robust ones, Geraniums, etc., are but slightly injured. After a few mornings of these early frosts, it often happens that there is a whole month of good weather, which is the finest of the year. Let the delicate plants go and give all the more care to those that may be saved with a little pains taken in protecting them. The tender plants that have been killed by the frosts should be removed at once.

*Dahlias* are spoiled by the first hard frost. Cut the stalks near the ground and lift the roots, selecting a warm day, and doing the work in the morning that the roots may dry all day in the sun before putting them away. Be sure to securely label the different varieties, and put them away in a cellar that is suitable for keeping potatoes.

*Cannas*.—The roots should be dug before the foliage is killed by the frosts, otherwise it will be difficult to keep them through the winter. It is better to lose a little of the beauty by early digging than to have the roots injured. The roots must not be allowed to wither before putting them in a dry warm place for the winter.

*Chrysanthemums* that are to flower in-doors should be potted at once. Those that are to bloom in the borders should be tied up and kept in good shape.

*Spring Bulbs* should be planted as soon as they can be obtained from the dealers. Double Tulips are very showy, and are deserving of more attention than they receive. The beds for the bulbs should be enriched with old well-rotted manure.

*Tender Bulbs*, like Tiger-flowers, Gladioluses, etc., must be lifted before the ground freezes, and stored in a cool place. Tuberoses yet to bloom may be lifted and put into boxes of earth and placed in the greenhouse or a sunny window.

*Straw and Leaves* make an excellent covering to plants of doubtful hardiness. Such a protection will cause a stronger bloom in the spring and make the grounds look neater for raking up of the leaves.

*Walks*.—This is a good time to make or improve the walks. A thoroughly-made walk is a perma-

nent improvement, and is the only kind that pays in the long run, to make anywhere on the ground.

*Finally*.—Do everything that in any way prepares for winter, or will aid in the busy spring.

### Greenhouse and Window Plants.

The greenhouse before this should have been put in readiness, that there may be no delay in bringing in the plants when the time comes. Soil, labels, moss, pots, and all other needed articles should be on hand ready for use, and in sufficient quantity.

*Bulbs* for flowering in pots should be potted as soon as obtained; the soil should be rich, made loose with a plenty of clean sand, after which the pots and plants may be placed in a cool and dark cellar to form a good growth of roots.

*Window Plants*.—The necessity of a gradual change must be emphasized in removing plants from the open air to the dwelling rooms. It is best to place the plants in a room where there is no fire, and one that can be opened during the day. After a while the plants may be taken to the close living-room, in which there is a fire.

*Hardy Plants* can be forced in window culture, and deserve more attention than they have received. Among these are *Dicentra* (Bleeding Heart), *Astilbe Japonica*, Lily of the Valley. All such should be taken up at once and potted, and kept in a pit or cellar until late in January or February, or later; when brought out for bloom, they should at first receive water rather sparingly.

*Seeds of Annuals* may be sown; Candytuft, Sweet Alyssum, and Mignonette, and other pretty annuals, are always in demand for cut-flowers.

*Hanging Baskets*, made up with new plants, should be well watered and kept in the shade for a few days. Do not place them in the confined air of heated living-rooms until too cold to remain outside.

### Bee Notes for October.

BY L. C. ROOT.

**THE HONEY CROP.**—The yield of honey from Basswood and other sources, in this section, has not equalled our expectations. During the last days of June the supply of honey, from basswood, promised to be abundant, but it was very suddenly and unexpectedly cut short. Reports from all parts of the United States indicate a small crop. We judge it to be less than one-half the usual average; many report an entire failure. In our own apiaries we secure over 15,000 pounds from 176 colonies. Thus far we have taken from the three selected swarms as follows: July 10th, No. 1, 77½ lbs., No. 2, 66½ lbs., No. 3, 83½ lbs.; July 13th, No. 1, 41 lbs., No. 2, 41 lbs., No. 3, 55 lbs.; July 19th, No. 1, 12 lbs., No. 2, 18 lbs., No. 3, 21 lbs. After the last date given we removed the swarms, with others, to where Buckwheat, Golden Rod, and Eupatorium are found in greater abundance than around the summer stands nearer home.

**FALL PASTURAGE.**—The subject of fall pasturage is of considerable importance, as with a fair yield of honey at

this season, breeding will be continued, and thus one of the essentials for successful wintering is secured. It will therefore be found profitable to study the sources from which a yield may be expected. In many sections buckwheat is the chief dependence for late honey. In other localities, like our own in the Mohawk Valley, Melilot or Sweet Clover, shown in fig. 1, is of great importance. But more generally, we think that the supply will be gathered

Fig. 1.—MELILOT OR SWEET CLOVER.

chiefly from Golden Rod, fig. 2, and Eupatorium, shown in fig. 3. These wild plants can be found upon rough waste land, in nearly all parts of the country.

**FALL MANAGEMENT.**—If surplus boxes have not been removed as directed last month, it should be attended to at once. If swarms have been supplied with extra

combs for extracting, they should be removed and packed safely away for use another season. The value of these combs, as well as those taken from piece boxes, cannot

Fig. 2.—THE COMMON GOLDEN ROD.

be over-estimated, consequently great care should be taken to preserve them. Mice and rats should be carefully excluded. If disturbed by the destructive moth, the removed combs should be smoked with brimstone.

An error appear in Notes for September, which might mislead the uninformed.

It should read, "the combs should be watched, and not, 'the combs in the brood-nest should be watched.'" There is no danger of combs in the brood-nest of good swarms being injured by the moth, at this season, and if weak ones were disturbed, it would be necessary to examine them and remove the moth larvæ, as by smoking with brimstone, the brood of the bees would also be destroyed. When boxes and extra combs are removed, close all upward and downward ventilation, and if the entrance is too large, make it smaller. This will aid in keeping the hive warm, and facilitate continued breeding.

**MARKETING HONEY.**—In marketing honey use every precaution to make it neat and attractive. Directions for preparing and casing honey for market, will be found in the *American Agriculturist* for October, 1879.

### QUESTIONS AND ANSWERS.

**HANGING AND STANDING FRAMES.**—"Do you not crush more bees, and are you not more liable to kill the queen with the Quinby standing frame, than with the hanging frame?"—We consider the standing frame quite as desirable, yet we, as well as others, in answering such questions, should not lose sight of the fact, that every bee-keeper becomes most familiar with whatever style of hive he adopts, and, naturally, can handle it better than any other, until he acquires a large experience.

**OPENING HIVES.**—"How often should a beginner open his hives?"—Just as often as practical operations require him to do so.

**BEES IN A GARRET.**—A correspondent in N. J. comes with the old question of the desirability of keeping bees in a garret. This story of arranging bees in a room in a garret where they will not swarm, and where the owner can go and cut out cards of honey for family use, at any time, is a very old one, and belongs with that other old story of the immense swarm of bees somewhere in the rocks, where bees pour forth in masses, and honey may

Fig. 3.—THE EUPATORIUM.

be found by the ton. As regards keeping bees in an attic or upper room, or even upon a roof, they may be so kept, if some practical hive is properly arranged in such a location. There are even some advantages derived, where but few hives are kept. But all things taken into consideration, it is preferable to have the bees placed somewhere near the ground.

containing a great variety of items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of room elsewhere.

### Text-Book on Agriculture Wanted.

The impression is gaining ground among thoughtful persons, that children who are to become farmers should have a primary education that will fit them for their future occupation, as much as those who are to become merchants, bankers, etc., and that the public schools should teach the principles of agriculture as well as those of business life. In view of a probable demand for such a work, the Orange Judd Company offer **A Prize of One Hundred Dollars** for the manuscript of the best elementary work that will give children an idea of the principles underlying the practice of Agriculture that is suited to the United States. The work should be adapted to the capacities of children of the age of fifteen and over, and must not exceed 200 12mo. pages. The work should give the best practice in agriculture, and the reasons for the same so plainly that they may be understood by youth, without requiring a knowledge of chemistry, and, so far as possible, avoiding the use of technical language. Manuscripts should be designated by some name or mark, and be accompanied by the real name in a sealed envelope; they should be presented on or before January 31st, 1881. If, in the opinion of the Judges, none of the manuscripts offered are deserving of the reward, the offer will be renewed; the successful manuscript to be the property of the Orange Judd Co.

**Reliable Business Men**, those who have both the *ability* and the *intention* to do what they promise, are the *only* ones invited to use the business pages of this journal, and those in charge of that department are under positive instructions to admit no others at any price; and they try to live up to it, and generally do, though once in a while they may make a mistake—to err is human—but *this* seldom occurs. We could make a fortune in a single year, and supply the paper at lower rates, if the advertising pages were thrown open to those who gladly pay high prices, as they can afford to, because they give little for much. But we mean our advertising pages shall be a valuable source of *trustworthy information* to our readers.—When ordering from, or corresponding with any of our advertisers, or sending for catalogues, etc., it is well to state that you are a reader of this Journal. They will know what we expect, and what you expect of them as to prompt and fair treatment.

**The Fairs, Complimentary Tickets, etc.**—One of the laws of Natural Philosophy is, that a body cannot be in two places at the same time, and with this law in action we are forced to decline a majority of the invitations. It is with regret that we realize the impossibility of attending many of these useful exhibitions, as we always feel well paid in old friendships renewed, information gained, etc. To all who have sent us premium lists, tickets, and extended other courtesies, we tender our hearty thanks, and hope that every fair, State, County, District, and Town, may be a perfect success. A list of the October Fairs is given on page 447.

**Death of Albert J. Meyer.**—Brigadier General A. J. Meyer, Chief Signal Officer United States Army, and widely and familiarly known as "Old Probabilities," died at Buffalo, August 24. While on duty as an assistant surgeon in the army on the Texan frontier, where a broad level plain and clear atmosphere offered superior facilities for signaling by vision, Dr. Meyer's attention was drawn to the possible advantages that might result from a system of night signals in army and even navy operations. As the result of his study and investigation he published in 1858 his "Manual of Signals for the United States Army and Navy." Dr. Meyer was soon appointed Chief Signal Officer (1860), and became actively engaged in developing a special signal service for the

army. His service during the war was of great importance. An instance of this was the saving of Allatoona, Ga., in 1864, by bringing troops by signals in time to relieve the post, the message being sent over the heads of the surrounding enemy. After the war General Meyer was largely instrumental in establishing telegraphic communications with military posts on the frontier, 5,000 miles of telegraph lines having been built under his supervision. By act of Congress in the spring of 1870, he was charged with the important duty of developing a national system of meteorological observations, and the success of the system, which was developed with remarkable rapidity under his admirable management, has led to a uniform international system of simultaneous meteorological observations over a large part of the northern hemisphere. The work which "Old Probabilities" has so thoroughly pushed forward must be of lasting benefit to all classes of people, but to none more than to the farmers, who may well feel grateful to General Meyer for his services, and only wish he had been spared for a longer life of usefulness among his fellow men.

**Charles L. Flint, Resigned.**—Mr. Flint, who from the first has filled the position of Secretary of the Massachusetts State Board of Agriculture, has resigned, and Mr. John E. Russell, of Leicester, has been elected in his place. Mr. Flint has long been the main spring and balance wheel of Massachusetts agricultural work, and it is fitting that he should have rest from the routine of official work, which he has done with such credit to himself, the State, and all concerned in agriculture.

**Windmills for Thrashing.**—"O. V." Montgomery County, Pa.—The very large windmills have power enough for thrashing, and when they are needed for other purposes on the farm might be used economically for this purpose, and are doubtless occasionally so used.

**Advantages of Draining.**—The intelligent farmer understands very well the importance of removing the excess of water from his soil. It makes the soil warmer; the sun's heat falling on a wet soil is used up in changing the water into vapor, and does not warm the plant as it otherwise would. Drainage allows a free access of air through the soil, an important condition of the best growth of agricultural plants. A longer season is also given—the drained land can often be worked considerably earlier in spring and also later in the fall.

### Society for the Promotion of Agricultural Science.

During the meeting of the American Pomological Society, held at Rochester in 1879, a number of gentlemen met in consultation over the needs of better farming, and to devise means for extending the Science of Agriculture. "They recognized the need of an educated public sentiment in order to secure progress in agricultural pursuits, and were aware that the hope of agricultural progress was in enlisting the efforts and the sympathy of the intellectual classes." A preliminary association was formed, the prime object of which, as stated in the call, "shall be the promotion of Agriculture by fostering investigation in science applied to Agriculture."

At the recent meeting of the American Association for the Advancement of Science, in Boston, a number of the same gentlemen, with others specially interested in the promotion of Agriculture, met together, and, after deliberating upon the plans that had been proposed by various gentlemen, formed themselves into the "Society for the Promotion of Agricultural Science." The organization at present is a provisional one, and assumes much the nature of the "Entomological Club," in being made up largely of members of the A. A. S., and will meet on stated days in the same city, and at the same time as the American Association for the Advancement of Science. It is the intention of this new Society to limit its number to 40 or 50 members, and hopes it may make its influence felt, and in time come to be regarded as an authority in the field of Agriculture, as does the National Academy of Sciences in its special domain.

Among the members present were Prof. G. C. Caldwell, of Cornell University; Prof. M. C. Fernald, Maine State Agricultural College; Profs. R. C. Kedzie, W. J. Beal, and A. J. Cook, of Michigan Agricultural College; Dr. A. R. LeDoux, formerly in charge of the Agricultural Experiment Station, North Carolina; Dr. W. G. Farlow, of Harvard University; Dr. E. Lewis Sturtevant, and others. The new Society has the hearty co-operation of Profs. S. W. Johnson and W. H. Brewer, of Yale College; J. J. Thomas, Patrick Barry, L. B. Arnold, and other scientific men who have deep sympathies in advanced agriculture. Prof. W. J. Beal was chosen President, and Dr. E. Lewis Sturtevant, Secretary. These gentlemen, with Prof. G. C. Caldwell, form a committee to develop plans of work, etc. Assuming little, in a quiet, inobtrusive way, this small band of earnest workers may do much in the field of practical, progressive, and intellectual agriculture.

## The Long Year.

### Read This.—Fourteen Months.

*All New Subscribers for 1881, whose subscriptions come to hand during this month (October), will receive the American Agriculturist for November and December of this year without extra charge.*

*The above applies to All new subscribers, from whatever source received—including Premium Clubs.*

*Those too distant to receive this number before October 31, will be allowed 10 days after its reception in due course of mail, to take advantage of the above in presenting the paper to their friends.*

## The Premium List. September Supplement.

The Supplement of last month's paper should be preserved for reference by all who received it, as a descriptive list of good Articles and choice Books, all useful. There is hardly a family in the whole country that does not desire and need one or more of these articles as a premium, or by purchase.

There is not a town or neighborhood in all the country where one or more persons of a little enterprise, may not secure one, two, or three of these excellent premium articles without money outlay, and at the same time confer a real benefit upon every person they shall gather into a premium list of subscribers, and readers. It only needs the will—the determination—to do it, and it will be accomplished.

**THIS MONTH** is a good time for the work. Remember that all new names for 1881, received in this month of October, are entered at once to receive the paper for November and December without extra charge. This applies to all new subscribers, including premium lists.

**N. B.**—Premium lists containing two or more names, may be made up of both new subscribers, and old ones renewing for another year. For other particulars, see **Premium List** in Supplement of the September *American Agriculturist*. Any one not having received it, will be supplied on application.

## Tenant Farming Again.

The able remarks about Tenant Farming in the August number of the *American Agriculturist* attracted my attention, and, as it so well accorded with my own views, I thought I would give you my ideas of the cause of failure of agreements between landlord and tenant. I am a tenant farmer, and I frequently hear intelligent people talking about the rescue of certain lands from the "careless hands of tenants." I also see occasional articles to the same effect; but, as you say, why have not these things a remedy? and if so, why has the remedy not been applied? There are many tenants, who have the right kind of landlords, that do succeed, and their landlords find a handsome return for all they invest on their farms; but I regret to say that such is not generally the case. The tenant system of farming in this country is generally defective, but that it is all the fault of the tenants is not true. No doubt there are careless tenants as well as careless men engaged in anything else, but an individual class should not shoulder all the blame, when the defect is from general causes. Tenant farmers are, as a rule, men of ordinary intelligence and moderate desires, and generally disposed to act fairly and honestly towards the owners of land, but when they find no disposition on the owners' part to help shoulder the burdens, they are apt to try and make it as light as possible for themselves, and where one landlord does not please, another is looked for. Therefore, to be brief, I would say that the root of the evil lies in *short leases*, when, under a better understanding, we might have our differences adjusted without changing landlords. The cause, I think, of short leases is generally a want of confidence in each other. Many owners of land get good tenants, but the reputed carelessness causes distrust, and that distrust often engenders selfishness. The tenant has but a short lease, and cannot afford to put on more than he expects to get off the land, for he may have to leave at the end of the year, and let some one else reap the benefit of his labor; whereas, had he the assurance of a longer tenure, he might go on improving, with proper assistance from the owner, from year to year, feeling that he was not only working for the benefit of the landlord, but that he was doing the best for himself at the same time. In changing, the landlord often gets a worse tenant, and the tenant a worse landlord, and both are dissatisfied.

I am on a small farm, and know I could do better on a larger one, but, because of the bad system of farming here, and more especially the bad tenant arrangements, I shall be careful how I change, as I might do worse. In this section the landlords do not like to do anything for their lands, except to be sure that the tenants sow and reap, and the tenants try to sow as little as possible for the owners' benefit. This is all wrong, and there is no real reason for it. Let the owners of land make up their minds to have longer leases and better tenants, and do what they ought for their lands, not expecting tenants to do all, and be assured that it will not be long before the discord and carelessness of to-day will be forgotten. I admit that the present state of affairs has gone on so long that, like all other evils, it will have to be gradually rooted out, as no arbitrary or forced measures would ever be able to eradicate it. "TENANT," Talbot Co., Md.

**Spring and Fall Pigs.**—Pigs littered in the fall or early winter, owing to the cold weather, lack of green food, etc., seldom make a good start, and in many cases are eaten so soon as dropped by their voracious dams. Pigs for the greatest profit should come about the opening of spring, with its fresh grass and warm sunshine; they can then be ready for the market by fall, and very few risks will be run. For this end sows should be bred in December or January. At one time large hogs were highly prized in the market, but now smaller ones are in demand, and such pork can be produced at less expense per pound than that of large hogs. Young hogs are the most profitable, born in spring and marketed in the fall.

**White or Yellow Corn for Feeding.**—"N. W. Y.," Hunterdon County, N. J. After studying all the analyses of corn we have access to, we cannot find that color is an indication of quality which can be depended upon at all. The Flint corns, however, have a slightly higher average value than the Dent corns.

**Whey: How to Use It.**—Whey is milk minus the cheese that has been removed. As cheese is the most highly nitrogenous portion of the milk, it follows that whey is comparatively weak in these important albuminous food elements. Milk being a perfect food, whey is a liquid lacking in nitrogen to make it complete as a food. In feeding whey to the best advantage this loss of nitrogen should be made good—as far as such a loss can be made good—by using some substance rich in the element in conjunction with the whey. This may be linseed meal, oatmeal, wheat middlings, or some such like substance. Whey thus supplemented will be found to be an excellent food for calves or pigs. For young pigs

—shoots—such a mixture gives very excellent returns, the food seeming to furnish all the elements necessary for the best growth of the animal. The great objection to whey has come from feeding it alone, and especially when its sugar had turned to acid by long standing.

**Apple Pudding.**—"After what is said in March No., 1880, about apple dumplings, I would like to say, we make apple puddings that "grandmother appears to like as well as the dumplings she used to make," and *pater familias*, who is authority on this question, fears no consequent danger to the digestion, the only objection being the crust will allow of all the good cream you choose to put on it. I use a gallon milk pan similar to fig. 3, page 184 of *American Agriculturist* for May. It should be heated gradually and a little ashes put on the stove to prevent breaking. Work some good butter in sufficient light dough (yeast bread, no lard or soda) to make a cake nearly as large as the pan, and one inch thick. Set it where it will rise. Fill the pan half full of apples, pared and cut in eighths. Add water to cook them and set on the stove. Lay over them the cake, which should be quite light and gashed. Cover tightly. If the apples cook quickly it will be done in half an hour. Turn quickly on a large plate—sugar and cream." \*

## Sundry Humbugs.

Medical matters have always formed a large share of the contents of our humbug column, for the reason that we look upon fraud in medicine, as one of the most pernicious. Among the most dangerous of medical humbugs, are those who pretend to be regularly educated practitioners. The absolute quack will, by his pretensions, disgust intelligent persons, but where one professes to be a regularly educated physician, and to have a diploma, there is no method by which one can readily satisfy himself that the so-called physician has a right to his claims. It is unfortunately the fact, that a number of persons who have attended medical lectures and have, perhaps, even graduated, should, failing to become established as regular physicians, fall into the practice and way of quacks and become vendors of nostrums and practitioners of some *Pathy* or other. These persons have a regular issued diploma, and we have at present no law which can deprive them of it. Besides these, there is another class who have diplomas, who have not gone through the trouble of studying or even attending lectures. For a long time it has been known that medical diplomas could be purchased for a moderate sum. In Europe it is vastly more difficult for one to obtain a medical diploma, than it is in this country, and the fact that an American diploma will allow one to practice in Europe has given encouragement to this sale of false diplomas. In this country one can, in most medical colleges, procure a diploma after two years of study, but this is not the case in Europe. Five years at the least, are required, and the examinations there are vastly more severe than in our colleges. In view of the higher standing of physicians in Europe, and the greater difficulty in becoming qualified to practice, many pretenders there have availed themselves of the opportunity to purchase diplomas which have been offered by a pretended medical college in Philadelphia. The Philadelphia newspapers, especially the "Record," which deserves a great deal of credit, have taken the matter in hand, and fully investigated the sale of bogus medical diplomas. It was found that a young man with sufficient money, could be made a full-fledged doctor and receive his diploma with as much Latin in it as in a regular one, in about twenty-four hours. It appears that one Buchanan was the chief operator in this diploma mill. He had associates, but they appear to have played a subordinate part. After much investigation and accumulation of evidence, this Doctor Buchanan was arrested, but before his case came to trial he is supposed to have committed suicide by jumping from a steamer. But even in his death (?) as in life, he practised deceit, for now it appears that Dr. Buchanan did not kill himself, nor did any one commit suicide, but an expert swimmer, hired for the purpose of representing Dr. Buchanan, pretended to destroy himself. It is estimated that thousands of these diplomas have been sold, each serving as a black flag to some piratical chap who is preying upon the health and pockets of the community.

While it is gratifying to know that this diploma mill has been closed, the fact that it could have gone on successfully for so long a time, shows that our laws in such matters are not so strict as they should be. Indeed the

sale of false diplomas might have continued for a long time to come, had not the number of American diplomas, in possession of foreigners, aroused the attention of European authorities and the matter was made a subject of complaint to our Ministers abroad who communicated the facts to our own government. It would be better for the health of the community were the laws regulating the practice of medicine and the sale of drugs vastly more stringent than they are at present. Indeed in some States there can scarcely be said to be any laws on the subject. While the possession of a diploma is not absolute evidence of skill on the part of its possessor, yet it shows that the holder has had opportunities to qualify himself to practice medicine; while the possession of one of these bogus documents merely shows that a man had money enough to purchase it.

## HUMBEG LAWYERS.

There are some lawyers who are in very small business, and we would suggest to one in particular who is engaged in writing threatening letters in behalf of a quack medicine vender, that he must be careful not to write anything that he wouldn't like to see in print. We do not know that we can prevent his writing such letters, but we can shame him out of it by publishing some of them. He had better take this as a warning.

## GAMBLING IN WHEAT.

Since the closing up of the swindling stock broker establishments, other ways of speculation appear to have been found. The desire to engage in a game of chance (the spirit of gambling) appears to be more general than people are aware of. Lotteries, though positively forbidden by law, flourish in all our cities, there being a large portion of the community who are not only not opposed to them, but who participate and take the chances in them. Indeed it seems very difficult to control this matter by law, there being so many ways to evade what appears to be very strict legislation. In a New England town a local law was very strict for the suppression of gambling of all kinds. The various games by which the people had been accustomed to gamble, being enumerated in the law. It was supposed that every known game was prohibited, but one day two men were seen at a table each with a dollar bill in front of him, and upon each bill was a lump of sugar. The owner of the lump of sugar upon which a fly first lighted, won the game and took both hills.

When stock gambling was suppressed, other methods of speculation appeared. Operators, even if not the same, evidently of the same class as the "Put and Call" brokers, are now sending their circulars over the country giving people an opportunity to bet upon the price of cotton and of grain and other commodities.

Look out for the New York Seed Company, a name taken by one of these speculating concerns. They send out blanks which allow one to bet upon the price of wheat at some future day. One of our friends who received a blank of this kind, writes to us in astonishment that the parties do not state what variety of wheat the Seed Company propose to deal in. There is no danger that any one will get taken in by these wheat and cotton speculators, who does not really desire to gamble in this manner.

## PEDDLING CLOCKS.

The business of peddling clocks did not die out with Sam Slick. Clock peddlers are said to be especially numerous in some of the Southern States. One of Sam Slick's methods was to ask to be allowed to leave a clock until he came that way again. Sam had an acute knowledge of human nature; he knew that if persons once became accustomed to the clock, they would not readily part with it, and whenever he received permission to leave a clock, he was very sure that he had made a sale. When he came around after a few months, it was very rare indeed that he would be allowed to take the clock away.

The clock peddlers of the present day, however, leave the clock, but at the same time take a note for two or three times the real worth of the time-piece. Trouble has already come from some of these clock trades, especially in States in which the law on the collection of notes is very stringent. Those who follow our repeated advice, to give no note whatever to an unknown person for any article whatever, or under any possible circumstances, will avoid all difficulty. One can now buy a good clock very cheaply, and there is no need of purchasing one that cost more than a few dollars, or more than can be readily paid for at once.

## VETERINARY QUACKERY.

There is not only quackery in regular medicine, but also in the treatment of animals. One of our subscribers sends us a circular which purports to come from the Veterinary University of Medicine in New York City. There is no such university in New York City and the so-called Professor is very careful not to give the street upon which that remarkable institution is located. The title shows ignorance in the use of language, and his circular indicates that the "Professor" and English gram-

mar are not on very intimate terms. The "Professor's" circular is ornamented by what we take to be his portrait, and it also has, as a trade mark, a pig with a very lively curl to his tail.

Regular veterinary practitioners, as well as other practitioners, do not advertise proprietary or secret medicines of any kind, nor do they avoid giving their location. At the bottom of this circular we read "Patented June 11th, 1878." What is patented, whether the portrait of the "Professor," or the circular, or the curl in the tail of the trade mark, we are unable to state; but it is a very pretty circular.

#### VALUABLE REAL ESTATE.

What is the use of having a gold mine while common dirt will bring \$10 a pound. This is Real Estate worth having—worth more than corner lots even. But this valuable soil is away off in Brazoria County, Texas. The writer has been through Brazoria County, but he was not aware of the value of the earth upon which he trod. This earth is not thus valuable for building upon, but it is claimed to be a sure cure for scrofula, neuralgia, and all the rest of it. This earth does not appear to be applied after the manner of the true mud cure, in which the patient is plunged up to his ears and left to soak; it is too valuable to be used in that way, but you take only a small spoonful of it and put it in a pint of water, and let it soak for ten hours, and then you take a teaspoonful three times a day—and it will do you just as much good as if you hadn't taken it. There can be no doubt that the fellow who offers it for sale makes a pretty good thing of it. He knew human nature well enough to put the earth at a good price; had it been \$10 a cart-load, who would have cared to have taken it in teaspoonful doses? It seems there can hardly be anything so absurd but it will find people to take and believe in it. We always did have a good opinion of Texas, and now that we know that at least a portion of it is worth \$10 a pound, we think more than ever of that beautiful State.

#### PLANT PEDDLERS OR NURSERY AGENTS.

With the autumn days come the Plant Peddler or Nursery Agent. One of these fellows with a glib tongue, a fast horse, or a highly varnished buggy, comes into a town, takes perhaps hundreds of dollars' worth of orders, and after he has done all the mischief he can, some good person will sit down and write us about it, asking if such a man is likely to do what he professes, and various other questions that would be very properly put before the orders had been given; but after the Agent has taken the orders it will be a very difficult matter for them to refuse to take the goods. However rascally such a man may be, it is hardly possible to prove it until the trees and plants come into bearing, and here is where these chaps have the advantage. They cannot be found out in most cases under several years, by which time they will have gone to some far off State and will be beyond reach. A little common sense would be a very convenient thing to have to use in these cases. If a man claims to be an agent of such and such a nursery, he will have proper credentials, and, if he is honest, he will be willing to substantiate his claims. If, however, he has no credentials it is very unwise to order of such a man, unless it is known that the trees, etc., will come from a nursery of good reputation; and it is very easy to ascertain this by writing to the nursery and making inquiry.

But why the majority of those who buy of such persons do not deal directly with the nursery, is a matter that we are quite unable to understand. If trees are ordered from a well-known nursery, and in the course of time proved to be not true to their names, one knows where to look for redress. Accidents may occur in even the best nurseries, and an honorable business man would make all the reparation possible should it be found that in fact trees were not as represented. These travelling chaps sometimes profess to sell fruits which have no real existence, or they describe well-known fruits in a manner which the facts will not warrant.

#### RUSSIAN APPLES.

For example, from Arkansas a man has been selling Russian Apples, claiming that they are imported from Russia and are better than others in every respect. Now there are Russian apples, and in far Northern localities some of them have proved of great value. As a general thing they are small and in some cases are not of high quality. But they are a great deal better than no apples, and our advice is always to plant the best that the climate will bring to perfection. Now, in Arkansas they have no more need of Russian apples than they have of snow-shoes, because these apples have no quality that make them especially desirable in a climate so mild as that of Arkansas. Then the agent had the Monarch of the West strawberry, which he describes as being unlike others, standing upright and the fruit never getting on the ground; all of which is simply nonsense. The Monarch of the West in some localities is a very good fruit, and in others a rather indifferent one; but it don't stand up high, and it does get on the ground. It seems that this man sold his stock much higher than it is quoted in

the nursery catalogues. It may be well, as those who bought of him are learning a valuable lesson, that they should pay something for their schooling. Our Arkansas correspondent winds up his letter with "Do you think he is a humbug?" Most decidedly we do.

**How to Dispose of Raw Bones.**—"J. H. J.," Mason County, Mich.—When bones can be ground of course they are made rapidly available as plant food, but at a distance of four miles they may gradually be made useful thus: Sledge up the bones as much as you can, and mix them with good active horse manure, two-thirds manure and one-third bones. The pile should then be covered with three or four inches of earth. It will heat, and when the heat has subsided the bones will be found very much softer. Shovel it over, throw out the big bones, and all that will break up, hammer again and compost them still further. Make a fresh pile of bones and manure, and throw in the hard cases of the former heap. Thus the bones will gradually yield to the ameliorating and persuasive influences of the compost heap. The outside layer of earth will prevent loss of ammonia during the fermentation of the heap.

**Tomatoes in Glass Jars.**—"R. T. R.," Henry Co., Ind., writes: "I cook the tomatoes until the froth, which always rises when they first come to a boil, disappears, or about as much as if getting ready for table; then put them in glass jars like any other fruit—taking care to have the mouth of the jar perfectly dry, and the sealing wax not too brittle. Much of the sealing wax sold in sticks ready for use, needs a little beeswax melted with it, otherwise, when cold, it does not adhere to the jar, and the failure of fruit to keep is laid to other causes."

**Nutritive in Fruit.**—The mind grasps values by comparison. The chemist tells us that an egg weighing an ounce and a half is equivalent in food material to 17 ounces of cherries, or 22 oz. of grapes, 30 oz. of strawberries, 40 oz. of apples, 64 oz. of pears. We thus see that fruits are not very solid food. But we do not think any the less of cherries, apples, and pears, because they are not as concentrated in nutritive elements as the egg. They are no less a part of the best food of the human race, and most persons will continue to eat them.

**Crystals of Sugar.**—"E. C.," a subscriber in British Honduras, sends, by the hand of a friend, a sample of beautiful clear sugar crystals or "rock candy." "Not," as he says, "such as we usually make. They were taken from a tin of sugar which was run off for syrup from a pan before it came to the point when we make sugar." Any moderately strong solution of sugar—or syrup—will thus crystallize on cooling and standing. The slower the crystallization goes on the larger and clearer will be the crystals. This is an old process for obtaining refined sugar of the highest purity.

**Sowing Oats with Wheat.**—The theory is that when wheat is sown late, and not likely to make a stand sufficient to protect a light soil from wind and washing, a few oats—say a bushel or a hushel and a half to the acre—sown with it, by starting quicker and making more growth, will form a covering to the soil, which will hold the snow, prevent blowing and injurious washing, and die in the course of the winter and then form a useful mulch and manure for the wheat. Mr. O. Voightlander, of Montgomery County, Pa., kindly reminds us that on such soil as his, a clay or clay loam, the growth of the oats may be so rampant as to smother the wheat. This we do not doubt, and wheat on such land would be least likely to be benefited by the oats.

**Confining Blackberry Roots.**—"Miss 'G.,'" Riley County, Kan. Such a cement wall as you make for a cistern, three feet deep, will keep your blackberry roots thoroughly within bounds, unless the wall is torn to pieces by the frost. This may probably be prevented by clearing away the earth on each side of the wall and laying boards a foot wide on each side, edgewise, alongside the wall and in contact with it, the upper edges of the boards being put below the surface of the ground. The boards will be moved and the wall remain firm.

**Jerusalem Artichokes for Cows.**—"C. S.," Tuckerton, Pa., writes that an acre of Jerusalem Artichokes with an average yield of 1,200 hushels will afford enough nourishment to sustain two cows, and with less labor than is employed in raising an acre of potatoes. "Pound for pound, they are equal in nutritive qualities to potatoes. Since these roots do not keep over summer, and as the cow will not thrive on them alone, it is necessary to supplement them with dry fodder during winter and to subsist her on other forage during summer. With the aid of this plant, three-quarters of an acre of land under high cultivation will nourish a cow during the whole year, and the soil will become rich without any other manure than that derived from the cow."—The roots of the artichoke should be planted in hills, three

feet apart each way, and cultivated frequently to keep the soil in good tilth and free from weeds. A tuber, or piece of tuber the size of a hen's egg, is sufficient for each hill, it being covered two or three inches. The plants will grow until frost kills the stalks. When fresh the whole plant, root, stalk, and leaves, may be fed to the cow. In winter she will need about a hushel of the raw tubers a day, with eight or ten pounds of hay. Artichokes can be fed from the 1st of October to the beginning of June, during which time 250 hushels will be consumed by each cow, together with about a ton of hay. "A good way to keep Jerusalem Artichokes in winter is to place them on the ground in the field in shallow layers, covering them lightly with the stalks of the artichoke or with straw, and then with a little earth. If the rain wets them it will not injure them."

**What to Do with Apple Pomace.**—The best disposition to be made of the pomace from a cider press is to encourage its decay as rapidly as possible, by adding it in thin layers to a compost heap; placing it in immediate contact with either animal manure, lime, or ashes. It may be utilized, or at least disposed of with some prospect of its being useful, by knocking it into pieces and shoveling it, a hundred weight at a time, into the pigsty. Thus it disappears and is returned to the earth for all it is worth—which is not a great deal.

**Swamp Muck.**—"W. L.," of Essex County, N. Y., writes: "I have read the article on 'Swamp Muck'—its Value," on page 340 of September No. of the *American Agriculturist*. I have a three-acre bed of muck, six to ten feet in depth. Averaging it eight feet, and calling twenty-seven cubic feet a load, it figures up 38,352 loads. This muck is pronounced superior to any known in Essex County. This is the starting point. Now, I have already in my barn-yard some twenty-five loads. I have drawn out and piled up about 180 loads. I have a seven-acre meadow that is to be turned over for corn next year. I have this muck, and at my command lime, salt, ashes, and plaster. What is the combination to be made?"—As soon as the muck is reasonably dry lay a mass of it about a foot deep, six feet wide, and as long as you please upon a dry and convenient place. Cover this with lime slaked with strong brine, to a dry powder, using enough to make the entire mass perfectly white. Cover this with four to six inches of muck, which lime again in the same way, and so on—each layer will be narrower than the first, so that it will hold its form. Thus, when three feet high, it will be about three feet wide on the top. The rain will not hurt it. It should be examined after about a month and worked over, making a new heap as close as possible to the first, and adding more or less lime in the same manner as before. Such muck will be in excellent shape in March or April to apply directly to the land, or to compost again with animal manure or anything of a fermenting nature, and will, when this undergoes heating in the spring, be excellent for manuring corn in the hill.

**Weeds.**—"If weeds are left exposed in piles a year, will their seeds germinate?" asks a correspondent.—Certainly; and some of them probably after ten years, if there were ripe seeds in the pile to start with.

**Composting** is the art of mixing organic matter, such as straw, muck, dead animals, etc., that must undergo decomposition before they become available as plant food, with inorganic matter that will absorb and retain the valuable gases that the organic matter would otherwise let pass into the air and thus be lost. Such a mixture must be kept moist, but not exposed to rains that would wash away the valuable soluble salts. Stable manure and muck make an excellent basis for a compost heap, with which ashes, leached and fresh lime, weeds (not in seed), waste matters, etc., can be mixed.

**Cochineal in Florida.**—The Cochineal Insect, a sort of plant louse, which abounds on certain species of cacti, and with the bodies of which a beautiful scarlet dye is made, and from which carmine is extracted, is said to do well in Southern Florida, though its native country is Mexico and the Northern States of South America. This being a fact, as stated by a Florida paper, it would seem worth while for enterprising people in Southern Florida to look into this matter.

**Plant Economy.**—Plants, like animals, can live on inferior food, but where it is abundant will select the best. Where food is lacking in quantity plants will contract their growth and devote all the food that is possible to the production of the offspring—the seed. It is a well known fact that anything which checks the growth of the plant tends to make it flower first, and if possible produce seed. It seems as if the plant realizes that its own life is in danger and takes the shortest cut to the reproduction of its kind; and in so doing often pinches itself and is very economical for the sake of future generations.

**Dr. George Thurber**, so long and widely known in connection with the editorial management of this *Journal*, and Dr. Manly Miles, in charge of the extensive *American Agriculturist's* Experimental Farm, sailed for Europe, Sept. 2d. These gentlemen are to visit the various Experimental Stations in Germany, France, and England, and will likewise devote time and attention to other places of special importance to all interested in progressive agriculture. Our readers will be fortunate in having the full results of their extensive observations and researches in the future numbers of the *Agriculturist*.

**The American Institute Fair** is one of the "institutions" of New York City. "New Yorkers" think a great deal of it. They take their families, and their country cousins, and they do what they can to make it worthy of the "Empire State," and of the business "Metropolis" of this Yankee Nation. The Fair was nominally opened on the 15th of last month, and by the first of October it will be in its full glory. The exhibition will be a very attractive one, and it will be a pleasant object to have in view for persons or parties coming to town before the close, which is on the 27th of November.

**Roup: What Is It?**—The disease of fowls, and especially young fowls, called Roup, is most prevalent during the late fall and early winter months, and has its origin in colds which the birds contract at this time. If not attended to the cold increases, the head swells, and a watery substance is discharged from the eyes, which in time may coat over and close them. The roof of the mouth and the tongue are similarly affected. As soon as the fowl is seen to be troubled with a cold, it should be given some meal mixed with Castor Oil, and its head bathed with a weak solution of Carbolic Acid—a few drops of the acid in a basin of water. If the disease is already somewhat advanced, a pill of Sulphur and Cream of Tartar (equal parts) should be given. The sick birds should be put by themselves and their throats and heads bathed frequently in a solution of Chlorate of Potash. The "ounce of prevention" that is worth so much is good management—good clean coops, roosts, fresh air, and pure water and food.

**Pampas Grass Plumes.**—These plumes, some fine specimens of which have been sent us from Florida, are the ripened flower clusters of the *Gyntherium argenteum* (a native of South America), a grass which grows in the South, and also to perfection in California. Nothing is nicer for room decoration than a fine cluster of these soft plumes, silky and white, twenty inches to two feet in length. They can be found in seed stores often colored blue, green, yellow, red, etc., but the natural subdued color is most pleasing to many.

**Lice on Stock.**—A number of letters ask for remedies for lousy stock. Vermin of some kind very frequently infest domestic animals; they are mostly of the louse type: small parasitic animals that must be removed by the application of some insecticide. A number of substances have been used to a greater or less extent, of which a few are mentioned below: One pound of Tobacco and six ounces of Borax boiled in two quarts of Water, to which Soft Soap enough is added to make a thick paste, has proved a good vermin salve. A mixture of Carbolic Acid and Soft Soap in the proportion of one to four makes a compound easy to apply, and very effectual. Shortly after the parts to which the soap mixture has been applied should be washed with pure water and a non-drying oil rubbed on. Oil of Turpentine and Lard Oil, equal parts, with a little Carbolic Acid, is perhaps the most convenient mixture to make, and effectual in its application. Animals that are affected with vermin need better care and higher feeding in order to overcome the drain that those parasites make upon the system.

**Quality vs. Quantity.**—It begins to look as if we had reached that point when *quality* in the products of the farm, orchard, and garden, is to take the front rank, and quantity become a second consideration. It is not so much the large strawberry or squash, or the number of quarts of milk, as the flavor, the richness, etc., that is being sought. This is encouraging.

**English Emigrant Colonies.**—Three years ago some gentlemen in Boston formed a Board for the encouragement of emigration from the populous centers of Europe to the fertile unoccupied lands in the West and South. Members of this board made a number of excursions to the Western States, in 1878, and finally selected a tract of land on the Cumberland Plateau in Tennessee. At the same time an English Board, organized for a similar purpose, was also making inquiries, and soon the Boston Board and the English Board were amalgamated; the English becoming the leading spirit in the enterprise. From the time of the selection of the 400,000 acres, in Tennessee, two years ago, until now the work of the colossal enterprise has been necessarily slow. Mr. Thos. Hughes, the celebrated English writer, and familiarly

known author of "Tom Brown's School Days at Rugby," is now in this country in the interest of this colonization scheme in Tennessee. The scheme can be viewed only as an experiment at present—the method proposed seems the best one for meeting many of the great difficulties with which agricultural life is generally associated in a new country. A hundred families purchase a fine tract of land at a low price. They unite in their numbers old and young of both sexes, persons of various trades and accomplishments, and begin work on the frontier, with many of the comforts of civilized life, the church, school, social gatherings, etc. Colonization of this kind will succeed, provided there is a strong bond of sympathy which holds the associated life together as a unit. A religion in common effected this in the Puritan colonies; and the Moravians are united in settlements all over the world, by ties that have all the indications of being enduring. If no bond of unity survives the passage of the sea, disappointed ones will soon begin to drop away, and the colony will break to pieces, but with the feeling that they can be more prosperous and happier together than separated, it will survive until the people are thoroughly naturalized, and the colony will continually increase by fresh immigration. The situation in Tennessee is well chosen, being attractive both as to climate and soil. We wish them every success, and hope soon to have a full and encouraging report from Mr. Hughes of his work.

(Basket Items continued on page 445.)

### The Guinea Grass, "Johnson Grass," Etc.

(*Sorghum halepense*.)

BY HERBERT POST.

I send you herewith an account of the "Johnson Grass" which is attracting the attention of farmers in various parts of the United States. It is not, as many are led to believe, a new grass, but it is only of late years that its value has been known or acknowledged. I have for five years past been cutting it and shipping as hay, and experience more than confirms the first expectations I had of its value. In the markets where it is sold it is preferred to the best Timothy hay, being more succulent and nutritious. The most reliable history I can obtain is as follows: In 1835, Governor Means, of South Carolina, obtained from Turkey some seeds of a grass, there known as "Guinea Grass." After growing it on his plantation it became known as "Means' Grass," by which it is still called in that State.

About 1845 William Johnson, of this place, being in South Carolina, obtained some of the "Means Grass" seed and sowed it upon his farm, where it now grows with great luxuriance. Here it obtained the name of "Johnson Grass," by which it is now most commonly known. It is a member of the *Sorghum* group, as its botanical name—*Sorghum halepense*—indicates. It is perennial, and propagated from both seeds and roots, the latter very much resemble those of the sugar cane; is very nutritious and eagerly sought after by stock of all kinds. It starts early in the spring and continues growing until frost kills it. In consequence of the deep penetrating roots, it withstands the drouth better than any of the other grasses, remaining green when other kinds are burned out by the hot weather. The richest bottom lands yield from one to two and a-half tons per acre at each cutting, and is cut two or three times each year. With the attention given to fertilizing in the Northern States, I doubt not its yield could be increased 50 per cent. per annum. For stock not at work it furnishes abundant food in grazing. Mr. N. B. Moore, of Augusta, Ga., after a trial of the various grasses for forty years, selected this grass as the best he could find. He planted one hundred acres of it, which yielded him a handsome income annually (Howard says \$7,000 to \$10,000). People who know the value of grasses no doubt wonder why this grass has not been more generally raised if so valuable. The simple reason is, Southern people have from time immemorial been taught to destroy grass; and every thing else that interferes with cotton must give way. While a grass possessing great tenacity, it is easily destroyed by plowing up and exposing its roots to the hot suns of August and September.

One bushel to the acre will give a good seeding. Sown in September or October, it will produce two good cuttings the following year. It is also sown

in the spring, but of course does not get as good a start. In the North the spring would probably be the best time to sow. It should be sown the same as other grass seeds, and brushed in or covered with a roller.

[This grass was described and illustrated in the *American Agriculturist* for March, 1877, in which it was stated that the Guinea Grass is found in Southern Europe, East Indies, Cape of Good Hope, West Indies, Australia, and Brazil. In September, 1879, this same grass was again treated under the name "The West India Green Valley Grass," with which the seed of the *Sorghum halepense* was advertised for sale through the Northern States.—Eds.]

### Preparing and Seeding Ground for Meadow.

The practice of sowing grass and clover alone without any so-called foster crop is becoming general. It is found that the supposed nursing crop has quite a different effect from fostering or encouraging the tender grass, but chiefly robs and destroys it, unless the soil is unusually rich. The more successful practice is to prepare the soil by thorough plowing—rolling if necessary, and harrowing so as to procure a fine tilth, and sow the seed early in the spring, without any accompanying crop. The preparation of the soil in the spring is completed by a dressing of fine manure, and a thorough harrowing, a shallow plowing being given if necessary. Harrowing will be sufficient in the majority of cases. After a fine harrowing the seed is sown. A mixture will be found most satisfactory. Mixed crops, as a rule, yield in proportion to the increase of seed. Thus a usual seeding of Timothy or Clover, or both, will give a certain quantity of hay; if Orchard-Grass is added, a crop of hay will be taken equal in amount to that expected from the Timothy or Clover, but two or three weeks earlier. A second crop may be taken later, of which the Timothy will furnish the bulk, and the Orchard-Grass will fill up the bottom. If Kentucky Blue Grass is added, or Rhode Island Bent, a later crop will be given, which can be mowed for rowen, or will give the best of fall pasture without injury to the roots of the Timothy or Orchard-Grass. The mixture here indicated is one that may be suggested for trial. It has been tried and found successful and desirable in all cases, and deserves a more extended application. The seed has been sown in the following proportions: One bushel of Orchard-Grass, one-half bushel of Kentucky Blue Grass, one-half bushel of Rhode Island Bent, ten pounds of Timothy, and six pounds of Red Clover. The Blue Grass appears later than the others, and fills up the vacant spaces left by the failing clover, which disappears after the second year. The advantage of the mixture is chiefly that a fine thick bottom is produced, which covers and protects the ground between the stools of the coarser grasses, and which furnishes a second crop for hay and a third for pasture. For soiling purposes the mixed seeding is even more useful than for pasturage, as the grass may be cut at any season without danger of injury from a dry spell. These particulars are more pertinent for the spring than the present season, yet if one would avail himself of them he must make preparation now, and not delay.

**The Chinch-Bug in Winter.**—Professor Cyrus Thomas, of the United States Entomological Commission, has made an exhaustive report upon the Chinch-bug, which gives some useful facts concerning its winter habits. Insects may pass the winter either in the egg, the "worm" or larva, the pupa, or as the full-grown, perfect insect. The chinch-bug adopts the last as its winter state. "When cold weather comes on those of the fall brood leave the now dry and hardened corn-stalks, and seek secure places in which to remain during the winter. Occasionally they take flight at the time, but usually they seek the most secure places which can be found in and immediately around the field. Any rubbish left in the field, if of a nature to meet their wants, is eagerly sought; corn shocks, straw piles, stumps, logs, and fence rows are used as hiding-places; they even conceal beneath the

clods when no better places can be found." Many go into the forest and along the bush-bordered streams. "During the winter they remain in a torpid or semi-torpid state, but are easily warmed into life and activity. As the cold weather becomes more and more severe they press deeper and deeper, if possible, into the recesses of their hiding-places. They prefer dry quarters if readily obtained."

There are two broods of this injurious insect during the season. The perfect insect comes forth in spring (March to May), deposits its eggs, which soon hatch and pass through the stages of development, to in turn lay their eggs, which produce the fall brood to hibernate until spring again.

### Weeds: Two Troublesome Daisies.

The Ox-Eye Daisy (*Leucanthemum vulgare*) and the Small White Daisy (*Erigeron strigosus*) are troublesome weeds. These plants, known by different popular names, are somewhat similar, the latter, however, having smaller flowers, and being annual or biennial, while the former has much larger flowers and is a perennial. The Ox-Eye Daisy is, therefore, the most difficult to get rid of, as cutting before the seed is ripe is not sufficient. These weeds are rapidly spreading over the whole country, and scarcely a farm is to be found free from them. They are mown with the hay, and the seeds are thus carried far and wide to new fields and fresh pastures. When Timothy is cut for seed these weeds are gathered with it and thus too the seed is sown in new places. Something should be done to destroy these pests. Early mowing of the meadows will destroy the small daisy, as the root will die the second year at least; but the Ox-Eye Daisy, as it is perennial, cannot thus be killed out. This can only be done by cultivation, and care to avoid using hay from infested fields, or foul grass seed. To cut the weed after the blossoms have formed, in the hope of preventing the seeds from ripening, will be futile. The seed will mature after the plant is cut, if the flower has been fully expanded, and hay that has been mown early to escape mixing of the seed of the daisy, will, after all, be infested. The plan most likely to be successful, is, to seed down with a mixture of Orchard-Grass and Clover; this is ready to cut in May or June before the daisies have prepared to blossom, and the flower stalks being cut off, a new growth must be made. This will frequently happen, however, but as a second cutting is usually made of the Orchard-Grass, this may still be taken before the second growth of the daisies can show itself in flower. In this way these weeds, of both kinds, may be brought into subjection. Otherwise a succession of cultivated crops for three or four years, should be grown, and every daisy that escapes the cultivator should be pulled. It may be thought that this is too laborious and expensive to pay. But the loss sustained year after year, and the damage done to the meadows and pastures by these weeds is considerable, enough to warrant some expense and a good deal of labor to eradicate them. A farm cannot be kept clear of them, if hay or seed is brought from land that is infested. Buy only pure hay and clean seed.

### A Ridge Smoother.

A correspondent who raises every year a good many roots, and whose practice has been to manure in the drill and cover with the plow, by ridging up over the manure and sowing the seed upon the ridges, first flattening them by a light roller, writes to the *American Agriculturist* that he has, or thinks he has, found a better way.

The roller was out of order and so he attached the trace chains, about six feet apart, to a 12-foot stick about 6 to 8 inches in diameter, in the way shown in the accompanying engraving. When

fastened so wide apart the draft is much steadier than if attached nearer together. The stick not being quite heavy enough, he added two fence rails, fastening them on by a chain near the middle. A bundle of four or five fence rails would doubtless do equally well. The weight of the smoother should depend upon the height of the ridges and the stiffness of the soil. The laborer carries the end of the middle chain in his hand, and with it guides the smoother, or lifts it if it becomes clogged or drags along weeds or sods. In turning also at the end of the drills, he lifts the implement by pulling back upon the chain. The action is very different from that of a roller; instead of flattening it smooths, and if sods or stones lay upon the ridges they are shoved off and not crowded into the drill, to be in the way of the seed sower.

For the best use of such a smoother, the land should be reasonably clear of large stones. It has one decided advantage over the roller, in that

A ONE-HORSE HOME-MADE RIDGE SMOOTHER.

grass sods, and many weeds, are not pressed and settled into the ground, to start up at the first rain, but are swept off into the hollows between the ridges, where they do little harm and the cultivator will strike them the first time it is used.

### Yellows in Peaches.

From the number and character of the letters that are coming to us, it is evident that, in some regions, this has been a very destructive year to the peach trees on account of the prevalence of the "yellows." A communication now before us is from "E. H. C.," St. Joe, Michigan, in which it says: "This vicinity has been a great peach region. The 'yellows' began here about ten years ago, and has swept every tree from existence. It is now claimed that the business (of peach-growing) is being restored in New Jersey, where the 'yellows' prevailed a few years since. It is the topic for discussion at our next meeting," etc.

A recent letter from one of the leading peach-growers in Delaware, informs us that there has not been much trouble in that section from the "yellows" for a number of years. But what is the "yellows?" This question is so frequently asked, that we wish it could be answered beyond a shadow of doubt. The "yellows" has been claimed by some to be of fungus origin, while others class it among those deranged states of plants not caused, as far as is known, by either fungi or insects. In order to find out more concerning the nature of this destructive disease, we have spent considerable time in examining the diseased parts with the compound microscope. In this examination, which included all parts of affected trees; the leaf, stem, fruit, root, etc., no traces of fungus could be found. This, of course, is by no means conclusive that the trouble is not caused by fungus, but it leads one to believe that if the "yellows" is caused by a fungus, it is probably one of those minute kinds like that of the yeast plant. Recent investigations upon the Pear Blight indicate that it may be caused by a fungus so small as to require the higher powers of the microscope to see it—that it can be artificially prop-

agated on healthy pear trees by a process of inoculation, etc. It may be that the "yellows" comes in the same category. It is certainly contagious, as has been proven beyond a doubt, and though not so sudden in its action as the Pear Blight, is, as many in the Michigan Peach Belt and other localities can testify, as destructive in the end.

### Our Apples in Sweden.

Dr. Eneroth, of Stockholm, has sent us a copy of his *Svensk Pomologi*, Volumes I. and II., bound in one octavo volume. This "Pomology of Sweden" is a capital book. We feel that the letter-press is worthy of the figures, and these we see are excellent, both the wood-cuts and the chromo-lithographs. They represent to the life the apples, pears, plums, and some of the small fruits of cultivation in that country, where, in the northern part especially, the length of the summer days makes amends for the shortness of the season. Dr. Eneroth also sends a recent appendix, entitled, when put into English, "Contributions to the Pomology of Europe at its Northern Limit." It will be interesting to know the capabilities of our American apples in this respect, so we have abstracted the following results of their culture for several seasons in latitude 59°, or thereabouts, which parallel, in our country, is about the middle of Hudson's Bay:

The BALDWIN appears to have failed altogether, and while beautiful exteriorly, is small, and the flesh is hard and dry, and does not come into eating until March. Not worthy of cultivation.

CANADA RED.—This is found to be an excellent keeper, and in quality is regarded as a rival of the Ribston Pippin.

The MCCLELLAN apple, thus far, gives promise of being a very useful variety.

COX'S ORANGE PIPPIN.—This unites high character with great beauty, and is regarded by Dr. Eneroth as one of the finest varieties of apple of which he has any knowledge, and he thinks that it will be cultivated everywhere in Sweden where fruit cultivation is at all possible. It keeps until April, when it is as good as in January.

NEWTOWN PIPPIN.—This seems to sustain its high character there, and, grown on espalier, has produced fruit of uncommon size.

The EARLY STRAWBERRY also appears to be well suited for Switzerland, and the SWAAR promises to be there, as it is with us, an apple of high character and of great value. A. G.

### Bare Pastures in Autumn.

Why should meadows and pastures be brown and bare late in summer and in the autumn? Lawns can be kept green, and grass plots for late soiling may be made to yield a good cutting in October, "brown October," as it has been called. The reason is that we deal more liberally with our lawns and soiling plots; it is not that we do not cut them close, for no grass land is cut closer than a well-kept lawn. It is not the climate either which we have been so ready to blame for our brown and dry fields, but something in our management. The fact is, we do not give our grass lands a chance to do the best they can. As we write we look out upon a grass field which has been cut the third time, but which has been top-dressed after the first cutting; and another beside it which has been pastured since it was cut in June. The former is in complete verdure, and the ground is thickly covered; the latter is a miserable exhibition of bare brown spots, interspersed with masses of rag-weed, left uncut by the cows; a fair representative of the majority of meadows and pastures. When we have learned that it is possible to make more profit from an acre of grass, than from an acre of any other crop, we shall do justice to it and treat our meadows liberally. Just now it is very important to consider what this treatment shall be. A coarse, tufty growth should not be left on the surface, which dies but does not rot, and is in the way of the mower next season; but this cannot now be removed by pasturing, which would only leave it in patches, nor by mowing, which would be

a costly way of getting rid of it, unless it is considered that the advantage would over-ride the expense. Perhaps to mow over such a surface, and leave the cuttings on the ground as a mulch and a fertilizer, might be a cheap way of disposing of it. But the most helpful thing to do, is to give a fair top-dressing of manure, fine and well rotted, before the winter. This will be well washed into the soil to nourish the roots, so that an early and rapid growth will be made in the spring, after a smoothing harrow has been run over the surface to break up any lumps that may remain. This early growth is the greatest advantage, because the crop being cut before the usual dry weather occurs, a second growth begins immediately, and is ready to cut very soon after the usual first cutting would have been made under other circumstances. During the hot, dry season, the soil is well shaded and protected, and the roots are uninjured, and when the second crop has been gathered, a third gets under way at once. This exacting treatment of course requires liberal return, and in this case the "liberal soul shall be made fat." In fact, niggardliness in the treatment of the soil is the worst economy; while liberality is returned many fold. This is especially true with regard to grass lands, which in America, on the average, can pasture one steer or cow, only, upon seven acres; while in England pastures that will fatten one hulloek per acre are common.

The want of manure with which we should be so liberal is the great difficulty. But this may be managed by devoting one special compost heap for this purpose, and enriching this with the addition of bone dust, potash salts, gypsum, or phosphate of lime and wood ashes. If this is prepared in time for use in the fall, and a light dressing of nitrate of soda and gypsum, or grass fertilizer is given after the first cutting, there can be little doubt that the dry brown appearance of the fields will be changed to verdure, and the barns filled with a largely increased product.

### A Cheap and Convenient Cow-Shed.

Mr. F. E. Gott, Spencerport, N. Y., favors us with a sketch and description of his combined cow-shed and pigpen. It consists of an open shed, with a box-pen for the cow one side, and the pigsty on the other. The whole shed being twenty

Fig. 2.—PLAN OF COW-SHED AND PIGPEN.

feet long and fourteen broad, covered by the same roof. It is constructed of hemlock lumber, and should not cost over fifty dollars. The outward appearance of the shed is shown in fig. 1. The posts in front are twelve feet in height, and the rear ones eight. The hoards are put on vertically, and battened on the sides. The roof is made of rough boards laid double, and breaking joints, so that it will not leak. The box for the cow is eight by ten feet, and six feet and four inches high, and has a feed passage four by eight feet adjoining it. The middle portion of the building is an open shed, seven by fourteen feet, and is used for storing muck, protecting the manure heap from the rains, etc. The pigpen occupies the left end of

the building, and is separated from the central or shed portion by a low partition, while the cow-stall is boarded up to the roof. The floor, being six feet and ten inches from the ground, provides storage room between it and the roof in which to put hay. Mr. Gott suggests that it would be better to have the posts two feet higher, thus providing a loft in

Fig. 1.—FRONT VIEW OF COW-SHED AND PIGPEN.

which over a ton of hay could be stored. The ground plan of this cheap and convenient building is shown in figure 2, giving the position of the doors, meal-boxes, open shed, feed-rooms, etc.

### Editorial Correspondence.

#### Fargo, Dakota Territory.

Turn to the map of North America, follow a line west from the westerly point of Lake Superior some 254 miles and you are at this place, which, in reaching, we have travelled 1,661 miles by rail from New York. To many of our readers, unfamiliar with the country, this doubtless appears to be far into the cold, inhospitable regions of the north—a very wilderness. Yet here we are, in a hotel, as comfortable as almost any in the Metropolis, in the midst of a flourishing town of 3,000 people, where yesterday we visited churches and Sunday-schools that seemed no different from those enjoyed at home. So far as the people are concerned they appear as if one of our best New England or New York villages had been taken up bodily and transplanted here—people, houses, gardens (minus the fruit trees), etc.

#### Some Wheat Fields.

After arriving here, we made a circuit of about 40 miles in a southwesterly and westerly direction over the nearly level, treeless expanse, broken only by two large streams, termed the Cheyenne and Maple rivers, margin-lined with a small strip of low trees and shrubbery. Throughout nearly all this long ride our road was hounded by fields of waving grain, or those thickly studded with shocks just cut; and these fields stretched away on either side as far as the eye could reach. At one point was a single plot of wheat four miles long and one mile wide, that is, 2,560 acres all in one body, while only roadways or small plots of grass or oats separated this field from other extensive wheat fields on all sides. Being able to judge pretty accurately of the yield of ripened wheat, we estimate the product of these numberless acres at full 20 bushels of plump grain, some say 22 bushels for each acre—varying, however, from 15 to 30 bushels, though generally pretty uniform.

#### The Noted "Dalrymple Wheat Farms."

While there are many large wheat farms hereabouts, of 300, 500, 1,000 acres, and upward, and a multitude of others are being opened, a great deal has been said in the papers about the "Dalrymple Farm," the accounts, as we have seen them for two or three years back, varying greatly. We have, therefore, attempted to get at the real facts, and for this purpose called upon Sheldon C. Dalrymple, who received us with characteristic western hospitality, and freely responded to our numerous queries. There are no less than nine farmers here bearing the name of Dalrymple, all related, and all originally from Warren County, Pa.—two of them, Oliver and S. C., having, on the way, occupied large farms in Minnesota for a few years. Most of them came here from two to five years since with scant

if any ready means, or, as they express it, "with nothing but a 'Grip-sack' in their hands. But they are all now, we believe, the owners of what would be considered ample domains in old Pennsylvania.

#### Location of the Farms.

Standing at the Railway Station, some 18 miles west of Fargo, and 2 miles east of Castleton Depot, there is to the southward what is known as the "Alton Farm," extending say 4 miles north and south, and  $3\frac{1}{2}$  miles east and west, and containing about 9,000 acres. Of these 6,000 are now in wheat and oats, mainly wheat—here, as on other farms, oats enough being raised to feed the working animals. East of the Alton Farm is the "Cass Farm," extending some 4 miles along the south side of the railway, and southward about  $2\frac{1}{2}$  miles—containing about 6,500 acres, of which 5,000 are in grain this year. North of the railroad and opposite the Cass Farm, and part of the Alton Farm, is the "Cheney Farm," extending east and west some 5 miles, and northerly an average of 2 miles. This embraces 5,500 acres, with 4,000 acres now in grain. On account of the original ownership of only alternate sections by the railroad, and the settlement by others of some plots, as well as the successive purchase of various pieces, the farms are not entirely compact, but have irregular outlines with intersected plots of other owners. The "Alton Farm," so named from its Superintendent, Alton Dalrymple, for easy reference, is owned entirely by Oliver Dalrymple. The "Cheney Farm" was originally owned by Benj. P. Cheney, of Boston, Mass., and the "Cass Farm" by Geo. W. Cass, of Pittsburg, now of N. Y. City. Oliver Dalrymple took charge of these with certain facilities in the way of capital, to work them, and with the privilege of owning an undivided half, if in 10 years he should make *profit* enough to pay the original cost. Though the time has scarcely half elapsed, we understand this has been done and he is now the half owner outright. The other Messrs. Dalrymple own various plots, mainly located north, northwest, and northeast of the "Cheney Farm" as follows: S. N. Dalrymple (brother of Oliver), has 1,500 acres 5 miles north. S. C. Dalrymple, who manages the "Cass Farm," owns 2,500 acres, 2,000 now in grain, and managed by D. W. Dalrymple. O. C. Dalrymple owns 1,500 acres, 400 now in grain, but he manages the "Grandon Farm," noted below. C. G. Dalrymple owns 320 acres, 240 now in grain. W. C. Dalrymple owns 160 acres all now in grain. N. M. Dalrymple owns 320 acres, 160 now in grain, and superintends the "Watson Farm." D. W. Dalrymple owns 320 acres, 110 now in grain. Most of the Messrs. Dalrymple are young men, and while owning smaller farms are at the same time managers or clerks on other farms.

Oliver Dalrymple is General Superintendent not only of the "Alton," "Cass," and "Cheney" farms above noted, but also of the "Grandon Farm," situated in the Red River Valley, 35 miles north of Fargo, containing 45,000 acres, of which 7,000 acres are now in grain; also of the "Watson Farm" of 23,000 acres, a dozen miles or so south-east of the "Alton Farm." He is, we judge, a general adviser of operations on all the farms above referred to. He is the "General-in-Chief"—the "Veteran"—and is spoken of as the "old man," though only some 45 years old. The others hold various ranks or offices, and the whole farming operations are carried on with a sort of military, or rather a manufacturing system, with close connections, yet distinctive departments, from the largest to the smallest matters. For example, in a plot of 420 acres of ripe wheat, we saw a row of 16 self-binding reapers, each drawn by three horses abreast, or more mules than horses, marching in procession around the whole field at once, each machine taking off a strip 5 to 6 feet wide, and dropping the bundles at the side. If a machine got out of gear, it turned aside and the rest of the phalanx moved on. An expert, "Superintendent of Machines," on horseback, with a kit of tools, galloped to the "lame" implement, and generally soon had it repaired and in line again. Thus every round cut and bundled a strip 80 to 100 feet wide, and 250 acres were cut during the day. Another Superin-

tendent of "Shoekers," with 20 to 30 men, followed the machines and put the bundles in shocks. In other fields similar gangs were at work, usually 12 to 16 machines. Some of the older and less perfect harvesters required an expert for every five or six implements. The 27,000 acres of wheat under the management of the Dalrymples, cut this year, required the use of about 150 of these self-binding harvesting machines to run for an average of about two weeks each. Imagine then 150 machines in a line of battle, some two miles in length, and you have an idea of harvesting by the wholesale in Dakota.

540,000 Bushels of Wheat.

As from our own estimate the entire 27,000 acres of the Messrs. Dalrymple will this year average at least 20 bushels per acre, the product will be full half a million, or 540,000 bushels—requiring 13,500 wagon loads of 40 bushels each to take it to the railway; and 2,160 freight cars, carrying 250 bushels each, to transport it to the distant market. These wagon loads in line, 50 feet each, would extend 120 miles; and the train of cars over 12 miles long, if each car occupies only 30 feet of track.

But this is only a small part of the wheat produced the present year in this immediate section. There are hundreds of other wheat farms ranging all the way from forty up to thousands of acres each, such as the "Sharon and Amenia Farm," 7 miles N. E. of Castleton, containing 25,000 acres, just starting, but having 2,000 acres in harvest; the "Williams Farm" of 3,000 acres, 2,000 now in wheat; the "Hadwin Farm," 5 miles west of Castleton, of 5,000 acres, some 2,000 in harvest. (From this farm 1,280 acres were recently sold, with the crop on, for \$33,000.) But

Men of Small Means

need not be set back by these large figures. We have seen plenty of men who came with only a few dollars and a team, and by breaking land for others and doing various jobs, then taking up land of their own and cultivating it, have gradually put themselves on the road to a competence. Some of these who preëempted the alternate sections of Government land 5 years ago, at first lived in "sod cottages" or "dug-outs," are now possessors of farms worth \$4,000 to \$5,000 and upwards. There are now no such lands close to the railway to be preëempted, but there are in counties north and south, and a little further west, where the railway has but recently extended. How good these lands are we shall know better when we see them a few days hence. There are some good railway lands still on sale at moderate prices we believe in the Red River Valley and on either side of it.

Briefs.

On the larger farms the threshing is mainly done by steam power, the portable engines and threshers being moved from place to place within easy hauling distance of the shocks. Jobbers also go from farm to farm with steam or horse-power threshers. . . .As soon as the main harvesting and threshing is over, the teams start at once plowing the stubble, and before winter it is all ready for spring sowing, which begins here about April 1st. . . .The straw is generally burned to get rid of it. . . .In breaking the new prairie, "back-setting" is preferred; that is, the sod is turned about 3 inches deep from May 10th to July 1st; then beginning with that first broken it is plowed about two inches deeper, turning the sod under. . . .Seeding is not done by drilling, but with the two or four-horse broadcast seeder. . . .Oats are grown mainly for the home teams, the yield running from 40 to 70 bushels per acre. . . .Corn grows fairly, but is not a certain crop. . . .The Dalrymples estimate that it costs inside of 45 cents per bushel to produce wheat and put it upon the ears, reckoning all expenses except interest on cost on land, and they would contract to grow it for that. The average freight from here to New York, including storage, commission, and all charges, is estimated to average a trifle under 30 cents per bushel. We can therefore calculate that so long as wheat will bring 90 cents to \$1.00 per bushel at the seaboard, it will pay well for producing it here. . . .Fields that have been plowed one inch deeper each year have now produced con-

tinuous good crops of wheat for five successive years. . . .Only spring wheat is grown here.

Why Crops Mature Far North.

People often wonder how it is that many crops grow and mature in the high latitudes, where the summers are of very brief duration.—The days are longer as we go towards the poles, until at latitude 68° the sun does not set at all for a brief period. Since the sun's light, as well as its heat, produces growth, the longer it is above the horizon the greater is the growth of plants per day. Thus, where the days average 21 hours of sun, there are, in 100 days, 2,100 hours of sunshine, while there are only 2,100 hours of sunshine in 140 days that have an average of only 15 hours of sunlight. As the isothermal (or equal-heat) line tends northwards after we pass westward of the south end of Lake Michigan, it is easy to understand why northern Dakota, Montana, Idaho, and Washington Territory, should be as favorable for farming, so far as climate is concerned, as some of the Eastern States lying much farther to the south.

Bismarck, Dakota Territory.

From Fargo to this place, 194 miles, we passed by rail over a woodless prairie, except along the streams, somewhat rolling, and of various quality as to fertility. There are numerous incipient towns at the Railway Stations, including quite a place at Jamestown, 101 miles this side of Fargo. There are here and there, all along the route, farms opened, and opening, by settlers. At several points fair crops of wheat are being harvested, and by careful selection multitudes can choose both railroad and government lands, that will fall little if any below those we have described, for wheat growing. Indeed the best wheat we have seen, taking the whole crop, is on the large Steele Farm, 40 miles east of Bismarck. We estimated the yield at 24 or 25 bushels per acre, at least, for all the fields in sight (28 bushels is claimed). Bismarck is a brisk growing town on the Missouri, already numbering 2,500 or more inhabitants, and promising to be an important future business center, as it already is on a small scale. The Northern Pacific Railway, which is being pushed through the Yellow Stone at the rate of one to two miles per day, is completed to a point one hundred miles west of Bismarck. At this point (Bismarck) we take steamer up the Missouri to visit some of the Indian Agencies at Fort Peck, etc. O. J.

Science Applied to Farming—LXI.

Our experimenters of last year gave us some interesting facts bearing upon the effects of different fertilizing materials upon the quality of the crops. From the full details published in the pamphlet reports I select the following:

"A number reported the amounts of 'good' and 'poor' corn; but fourteen, however, had made thoroughly accurate weighings. The percentage of 'good' corn were as below:

NUMBER OF POUNDS OF "GOOD" CORN IN 100 POUNDS OF TOTAL CORN, WITH THE DIFFERENT FERTILIZERS.

The figures accord with common experience that the largest crop has the largest proportion of good corn. I see nothing to account for the poorer average quality in 1879, except the bad season.

Ratio of Stalks to Shelled Corn.

The weighings of corn and stalks were made at different stages of dryness. In some cases the stalks were cut above the ears, in others close to the ground. The results are consequently discrepant. The averages are interesting as showing the relative effects of the fertilizing materials. The figures represent the number of pounds of stalks to 100 pounds of shelled corn in 12 experiments.

The proportion of stalks to shelled corn is smaller in the larger crops, and conversely the poorer crops have more stalks for the same amount of corn than the better crops. Contrary to what is commonly supposed, the nitrogenous fertilizing materials do not seem to have increased the amount of stalks as compared with shelled corn. As to

The Effects of the Fertilizers on Quality of Other Crops,

there are but few reports. Several have spoken of the quality of the potatoes grown with chemicals as compared with farm manures. The nearly unanimous testimony is that the potatoes with artificial fertilizers were of finer quality, and less disposed to rot than with the farm manures. The very general good results from the use of potash salts with potatoes, makes it very desirable to know the effect of muriate of potash upon the quality of the produce. It is commonly stated that potatoes grown with the muriate (chloride), are less "mealy," and more inclined to be "soggy" than with the sulphate. Such reports as I have, however, represent the potatoes grown with the muriate as of entirely satisfactory quality. The sulphates are rather costly and variable in composition, while the muriate is reliable, and so concentrated and cheap as to be within the means of almost every one who has potatoes to grow. If it can be demonstrated to bring potatoes of good quality, it proves, and I certainly believe it will prove, of inestimable value for this purpose in all our older States.

A Word to this Season's Experimenters.

I have given the above notes of what our experimenters have been doing with a purpose. The blanks that are sent for reports of the experiments bear the motto: "One great want of our Agriculture is closer study and observation by farmers." It is not merely the facts observed and reported, but the habit of accurate observation that will do good. To encourage this is one of the great objects for which the experimenters have been planned. And so I trust the experimenters will pardon me if I repeat here the requests made in the directions and blanks, that they make full and accurate reports of the details of their experiments. We want to know not simply how the superphosphate and potash salts, farm manures, and other materials, compare in the different trials, but how the results are affected by the different circumstances of soil, previous treatment, methods of tillage, of application of the fertilizer and cultivation of the crop, weather, effects in succeeding seasons and succeeding crops, and so on. This collecting and comparing of the experiments of intelligent men under varying circumstances, is one of the ways in which great good can be got from Science applied to Farming.

W. O. ATWATER.

## A Complete Cottage, Costing \$1,100.

BY S. B. REED, ARCHITECT.

These plans are for an inexpensive seven-room dwelling, similar in character to those published in last month's *American Agriculturist*. Several of these cottages have been erected in the manufacturing districts of the Eastern States, where they are regarded with special favor. They are equally adapted to most other parts of the country, and will be found to be very convenient, and to contain sufficient room for a family of six persons. For economical reasons, but three rooms are usually

Fig. 1.—SIDE ELEVATION OF THE HOUSE.

appropriated to general use—a parlor, dining or sitting-room, and kitchen, the remainder being furnished as chambers. In such cases the apartment marked "Dining Room" on the plan is used as a bedroom, making four chambers in all, and increasing the real capacity of the house to accommodate a family of eight persons.... **Exterior.**—Two elevations are given (figures 1 and 2). The foundations show 2½ feet above ground, a good height for convenient entrances, besides giving opportunity for suitable outside windows from the cellar for light and ventilation. The outside openings and dressings are sufficiently varied to make the whole interesting and somewhat picturesque. The front entrance is of good width, and has a roof resting on chamfered columns and side railings of open work. A square-angled bay-window projects in front, with chamfered work, below the sashes. The cornices, gables, belt courses, etc., are taste-

Fig. 2.—FRONT ELEVATION.

fully arranged, giving opportunity for the proper distribution of shades in painting.... **Cellar.**—It is of the size and shape of the main house section, as shown in fig. 4. Its height is 6½ feet; it has an outside entrance under the stoop, and is lighted by three windows. The kitchen is supported by piers, and the spaces between are inclosed with boarding.... **First Story** (fig. 3).—Height of ceiling 9 feet. The front entrance opens from the veranda to a vestibule, and from it to the parlor and dining-room. The Parlor is pleasantly arranged with a bay-window in front, and single windows in two of

its sides, giving views in three directions. The chimney is placed directly opposite the bay-window. Suitable spaces are allowed along the walls for the furniture usually required in such an apartment. The Sitting-room has windows in three of its sides, and doors leading to the dining-room, kitchen, and a closet. The Dining-room has two windows on one side and connects with the kitchen, two closets, and the cellar stairs. (Should this room be made a chamber, as before suggested, then the space under the main stairs may be used as a closet.) The Kitchen has three windows, with outlooks in two directions, an open fire-place, a sink,

door leading to the outside rear stoop, and a kitchen pantry; the latter is of good size, has one window, and is thoroughly shelved. This "pantry" arrangement is a necessity in a New-England house, as in such an apartment their stores are kept and most of the pastry work and preparations of food for the table is done. On one side just below the window a broad shelf is placed, extending the whole length; underneath

and attached to this shelf are three drawers, 5 inches deep and 18 inches wide, for towels and such things. The remaining space is left for barrels, pails, etc. Above this shelf at each side of the window and across both ends, shelves 10 inches wide, placed with convenient space between for crockery, spice-boxes, etc. On the door or opposite side, cleats and projecting pins are put for suspending the various utensils used in cooking. To house-keepers who have once used such an apartment, they are ever after indispensable.... **Second Story** (fig. 4).—

Height of ceiling 7 feet. The stairway ascends from the lower vestibule to a central hall, which is lighted by one small window. There are three fair-sized chambers and three closets. Each room adjoins a chimney, giving opportunity for the use of stoves when required.... **Construction.**—The foundation is of broken field stone and mortar, neatly pointed on the outside. The frame is of sawed timber, siding of "novelty" pattern, gables of vertical boarding with their lower ends cut to pattern and battened. Roofs of shingles. The balance of the materials may be inferred from the following table of **Estimates.**—Cost of materials and labor:

87 yards Excavation, at 25c. per yard.....	\$ 21 75
1,150 feet of Stone in foundations, at 8c. per foot.....	92 00
3,000 Brick in Chimneys at \$12 per M.....	36 00
518 yards Plastering, at 20c. per yard.....	103 60
2,138 ft. Timber, at \$15 per M.....	32 07
1 Sill 4x8 in. 155 ft. long.....	36 00
1 Tier 4x6 in. 131 ft. long.....	9 00
1 Plate 4x6 in. 101 ft. long.....	53 20
1 Ridge 2x6 in. 62 ft. long.....	15 00
300 Wall Strips, at 12c. each.....	36 00
60 Joist, at 15c. each.....	9 00
190 Siding, 9½ in., at 25c. each.....	53 20
Cornice materials.....	15 00
400 Shingling Lath, at 6c. each.....	24 00
63 bunches Shingles, at \$1.25 each.....	83 00
200 ft. Tin Valleys, Gutters, and Leaders, at 8c. p. ft.....	16 00
150 Flooring (inside), 9½ in. wide, at 25c. each.....	39 00
30 Flooring (outside), 4½ in. wide, at 15c. each.....	4 50
3 Cellar Windows (complete), at \$3 each.....	9 00

Painting, \$75; Carting, \$15.....	90 00
Carpenters labor, not included above.....	125 00
Incidentals.....	81 88
<b>Total.....</b>	<b>\$1,100 00</b>

"Round Up," is the term used by the herders upon the Western Plains when they gather all the cattle together at a stated place and assort them. It is to be remembered that in that country there are no fields and fences, but all the herds run together and a sort of mutual cooperative care is exercised over the combined herd. Upon the day of the "Round Up," which is advertised and other-

wise made known, the men on horseback scour the country over and drive in all the scattered droves to the place appointed for making the "Round Up." The cattle are assorted according

Fig. 3.—PLAN OF FIRST STORY.

to the brand upon them, and are placed by themselves. After the sorting is finished, the herds are counted, those ready for market are driven away for sale, the calves are branded and then the herds are let loose to wander over the plains as before. The branding is done by a hot iron which makes

Fig. 4.—PLAN OF SECOND STORY.

some letter or "trade mark" upon the skin of the animal. The process of branding is to some extent a cruel one, but it seems to be the only way of making a permanent mark upon the roving animal. The brands are registered in the County Clerk's office, and the mark is the undisputed title of ownership against all other claimants. Adult animals without a brand are public property, and can be branded for his own by any person.

### The Columbian, Black-Tailed Deer. (*Cervus Columbianus*.)

The beautiful Black-Tailed Deer is quite generally distributed over the western portion of the North American continent, inhabiting most of the hilly lands of California, and extending on the west of the Rocky Mountains nearly to Alaska. It was first noticed by Lewis and Clark (near the mouth of the Columbia River), while on their expedition to the Northwest, but it was not until the discovery of gold in California that this Deer became generally known to white men. The Black-Tailed Deer is a trifle larger, and of a stouter build, than the Virginia Deer, measuring six feet from tip of the nose to the end of the tail, with a height at the shoulder of two feet and six inches. As shown in the engraving, this Deer has a tuft of long, pendulous hairs hanging from the umbilicus backwards between the hind legs. The horns are cylindrical, and twice forked, and have a spread of nearly two feet between

the superior prongs. The antlers bear some resemblance to those of the Red Deer of Europe. The ears are narrower and the head less pointed than in the Common, or Virginia Deer. The tail is dark brown at its junction with the back, but the color deepens to a black towards the tip, giving this species of deer an easily distinguished characteristic, and one from which it takes its common name. The gait of the Black-Tail is not so graceful as that of the Virginia, it having a bound more like the Roebuck of Europe. The Black-Tailed Deer is better known to the western miners than to any other class of white men, and to its nourishing flesh many of the gold seekers owe their lives in times of scarcity of food.

Auduhon gives a vivid description of the difficul-

the Deer, but in vain; at last they gain the next summit; the object of their chase is at hand; suddenly they see him—a fine huck; he is yet on the declivity of the hill, and they cautiously observe his motions. Now they see some broken ground and rocky fragments scattered towards the left; they redouble their caution; locks are ready cocked; and breathing rapidly, they gain the desired spot. One instant—the deadly rifle has sent its leaden messenger and the huck lies struggling

THE BLACK-TAILED OR COLUMBIAN DEER (*Cervus Columbianus*).

in his gore. Short work is made of the return to camp if no more deer signs are about; and a straight cut may bring the hunters home in less than an hour, even should they have been two or three in following their prize." The writer was once, for several months, at a house on the Rio Grande, not far from El Paso, at which there was a tame Black-Tail. The house was built in the Mexican style, in a square form, with a court in the center, and the deer had the freedom of this yard. The animal having no horns, the dogs apparently thought it to be defenceless, and would attack to worry, if not to bite the deer. When the right moment came, the deer would stand upon its hind legs, nearly erect, and with its forefeet close together, strike with its sharp hoofs a tremendous

### Dogs—The St. Bernard and "Cocker."

Dogs are so easily taught and are capable of such noble traits of character that we cannot but look upon them, as a class, with respect, however much we may despise some particular cur. There is no more faithful, keen-sighted, sagacious, thoughtful and courageous friend in the whole brute creation than a well-trained and intelligent dog. From the earliest time he has been, and will continue to be,

the close companion of man. There are dogs for a hundred special purposes; they having been bred for centuries to some particular end; some to hunt birds, others to chase the fox; some for short legs and long hair, others for length of limb and shortness of hair, etc., etc. Out of this long list of breeds, and cross breeds, it is difficult, in fact, impossible, to select the one best fitted for the farm. It is so much a matter of taste or fancy that each one must, and generally will, select his own dog. There are certain points, however, that a farmer's dog should

possess in order that he may be a profitable adjunct of the farm. He should be a faithful watcher of persons and property, and at the same time not savage to strangers within the gates—he should be safe as well as a means of safety. He should be at home and at peace with the live stock, being able to handle them with gentleness, and above all easy to learn, and obedient to his master. This may be asking a good deal of a dog; but there are those which meet the requirements and they are the dogs that it pays to have on the farm.

THE MOUNT ST. BERNARD DOG (fig. 1), is closely related to the Mastiff, but in temper and disposition more like the Newfoundland dog. Until recently this dog has been confined to the Alps and neighboring countries, where he has long been of

Fig. 1.—THE SMOOTH MOUNT ST. BERNARD DOG, "MONARQUE."

ties in the way of hunting successfully this extremely cautious Deer: "Above all things, keep the wind in such a direction as not to carry the scent to the animals." We give a portion of the description: "Once the trail has been almost lost in the stony broken ground they pass, but again they have it. Now they approach and search in different directions the most likely places to find

hlow. If the dog was able to get away, which was not always the case, he was never known to repeat the attack. There is a difference of opinion as to the flesh of the Black-Tailed Deer, some regarding it as dry and less palatable than ordinary venison. The writer has frequently eaten it, but at times when any fresh meat was a luxury; under those circumstances it is difficult to form an opinion.

Fig. 2.—THE COCKER SPANIEL, "BRUSH."

great service in recovering persons lost in the snow-storms of that region. The actions of these dogs over a snow-bound traveller are said to be almost human, so great are the intelligence and sympathy which they exhibit. There are two quite distinct varieties of the St. Bernard dog, differing principally in the length of the hair, and known as the Rough and Smooth St. Bernard. The best

strains of both varieties are now to be found in this country, and they make remarkably good tempered and trusty household dogs, being particularly gentle to women and children. The Smooth variety of St. Bernard, shown in figure 1, is red and white, with a broad white collar—many prefer the Rough or the long-haired variety, the color of which is often a deep brindle.

THE COCKER SPANIEL, OR "COCKER," includes a number of sub-varieties, so that it is difficult to describe it very definitely. It may be said in general terms to be an active spaniel, averaging about 14 pounds in weight, elegant in outlines and of a lively and spirited carriage. The head is round, the forehead being oval, the ears are of medium size and well clothed with soft, wavy hair. The tail (which is usually cropped), is naturally long, being somewhat like, but more bushy than that of the Setter—to which breed it has a general resemblance. The "Cocker" is the hunter's dog, having been bred and trained as an aid for the sportsman. While out for game he has his own peculiar characteristics. "Stonehenge" says: "In hunting he keeps his tail down like the rest of his kind and works it constantly in a most rapid and merry manner, from which alone he may be known from the Springer, who also works his, but solemnly and deliberately, and apparently without the same pleasurable sensations which are displayed by the Cocker." The illustration, fig. 2, on previous page, is a portrait of Dr. Gillette's dog "Brush," an excellent representative of the Cocker Spaniel.

### Plan of a Poultry House.

"W. R. S.," Morris Co., N. J., sends sketches of a Poultry House, and says: "Thinking, perhaps, that from the plan of my hen house a new idea might be gained by any who may be contemplating a plan by which to build a hennery, I will give mine as briefly as possible. My principal considerations

Fig. 1.—FRONT VIEW OF POULTRY HOUSE.

in devising a plan were cheapness, warmth, ventilation, convenience, and with these in view, I have succeeded in building a house, at a cost of less than \$45, being 6 by 16 ft. on the ground. I have kept 75 fowls in it at one time, and for a period of several months; and as far as my experience extends, I am thoroughly convinced that with a properly arranged house, and proper care, fowls can be kept in large numbers, yielding as much profit as if with more room and less care. The front of the house faces south-east. The side or back, and end,

Fig. 2.—INTERIOR OF POULTRY HOUSE.

not seen in figure 1, is made water-proof by paint and putty, and has no opening of any description. The nest alley, figure 1, *a*, is 16 ft. long, 2 ft. wide, 1 ft. high at the back, *d*; *b*, braces to support alley; *c*, strip of iron bolted to alley and main building (inside); *e*, light of glass, one in each end of alley. The cover to alley is hinged to main building and

used as a lid; it can be locked if desired. The windows are fastened on by butt hinges, *f*, *f*; *E*, dotted lines, showing a position in which the win-

Fig. 3.—THE FRAME OF ROOSTS.

dows may be braced by a stick, *h*, and give ventilation without draft; *g*, entrance doors; *i*, hooks to fasten windows. The roosts, *a*, are made as shown in figure 2, and are simply laid on the joists, *J*, *J*, the frame (fig. 3) not being fastened to the joists. The roosts may be raised to *b* by placing the stick, *c*, under them, and the house cleaned, etc., without the roosts interfering in any way; *d*, *e*, *e*, ladders. There is a platform, *f*, opposite the entrance to nest alley; *g*, entrance to nest alley; *h*, space in nest alley in front of nest boxes; *i*, nest boxes; *k*, fowl entrance to house."

### More About Tenant Farming.

We have often heard the remark made that farming property in this Commonwealth does not, on the average, pay three per cent interest. The statement is generally accepted as substantially true, though we may not be able to establish it by statistics. We were not a little surprised, therefore, to find a landholder in our recent travels that claimed that his farm, which he had rented for sixteen years, paid him now an interest of six per cent, and in the flush times after the war that paid ten per cent annually. After drawing from him the strong points of his management, we concluded his estimate a reasonable one. The farm in question is an old homestead, upon which he was born and brought

up, and which he managed in person for many years, until he made money enough to live easier in the neighboring village. In the letting of his farm, he had the advantage of knowing just what he wanted in a tenant, and the details of the management needed for successful results upon that particular piece of territory. He had also a strong personal interest in it as his own home, and the home of his ancestors for several generations, which doubtless had something to do with the satisfactory returns which it gave. The man should smell of the soil he handles who would make money out of it. The first strong point in his success was a good soil to begin with, on the best streak of land in the township, indicated by the size and quality of its timber, when it was selected by its first proprietor, two hundred years ago. It has maintained its reputation for good crops from that day to this, and its owners have never been poor men. It was kept in good heart under his own management, and was handed over to the tenant with a large quantity of manure in the yard and sty, and a good system of husbandry laid out for him. Without a good soil, in good heart to begin with, the investment must have paid less interest. The farm consists of 280 acres, and is valued at \$10,000. The leading interest is the dairy, making butter for the summer market, with pork and poultry enough to use up the skim and buttermilk. Plenty of manure made by feeding out all the hay and most of the grain raised upon the farm is one of the maxims of farm management. The tenant must make as much manure, measured by the cart load, as he found upon the farm. Sell no hay, no matter how much is left over, is another of the maxims. Put if any is sold, its equivalent in manure must be brought back upon the farm to increase its fertility. The remedy for a surplus of hay, in barn or stack, is an increase of stock, which adds to the manure heap and adds to the animal products that may be sold the following season. There is always a surplus of hay to guard against such seasons of drouth as we had last spring, and short crops. Another item in

this farmer's policy is long leases. He gets the best possible tenant to start with, and then makes it for his interest to stay. As the farm is rented at the halves, it is not very difficult to do this. If the tenant knows that he is to continue for a term of years, he has a common interest with the owner, in making manure, in raising good stock, in thorough cultivation, and in keeping up the farm. Ten thousand dollars invested in a farm like this, and managed as this is, is as secure as Government bonds, and pays a better interest. Would that we had more farming of this sort. CONNECTICUT.

### A Corn Shock Tightener.

Mr. "W. P. H.," Douglas Co., Kansas, sends a description of a Tightener to be used for drawing the tops of corn shocks together at cutting time. Cut a sapling, or any stick, two inches in diameter at the butt, and several inches in length, shave it off smooth and sharpen the small end. A three-fourth-inch hole is bored an inch or two from the large end, and a seasoned hickory, or an iron, pin eighteen inches long is inserted for a handle, as shown near the bottom of the accompanying engraving. Tie one end of the rope (which should be long enough to pass around the corn shock), to the larger end of the stick, putting it above the cross pin on one side and below on the other, so that it may not slip. A loop is tied in the other end of the rope and the Tightener is ready for use. In drawing the top of the corn shock together the

SHOCK OF CORN WITH TIGHTENER.

sharpened end of the Tightener is thrust into the shock, at the place where the band is to go, and the rope is thrown or carried around when the loop is put over one end of the cross-pin. "Now take hold of the handle and turn as with an auger; both ends of the rope being fast it coils around the stick and the shock can be made so small and tight at the top that it will stand up straight from September until April, and turn rain almost perfectly. A boy can make the Tightener in half an hour. After tightening up the shock, we tie with small wire, such as is used for binding grass—then untwist the rope and take another shock. In twenty minutes two men can tie what they can cut in a day."

Marsh Hay is not held in high esteem unless it is cut when very green and well cured and housed. Even then it is light, and should be fed in combination with richer foods. When left standing until late in the season it is dry and tough, and though rich in ash elements, it is inferior food, and not the best of litter, as it decomposes so slowly.

Salt-marsh hay is probably no more nourishing than that from fresh marshes, but is relished better by cattle because of its saltiness. If farmers can readily get salt hay, or even that from the fresh marshes, they should do so, and if cut early it may be fed with an addition of meal or other strong food. The gain in manure for cultivated fields will compensate for the trouble in getting it in most cases.

### Wayside Fountains.

On a recent trip, visiting farms in Tolland County, Conn., we found several fountains by the roadside for the convenience of travellers. One was fed by a copious spring on the hill side near the line of the road. It was conducted by a narrow trough and bit of inch-iron pipe, into a large iron-bound hoghead placed near the road-bed, and so high that horses could drink from it without loosening the cheek rein. The overflow passes off into the gutter, and after watering the thirsty traveller and his beast, blesses the adjacent meadow with many extra blades of grass. There is a fall of two or three feet as the water plunges from the spout into the cask, which is pleasant to the eye and music to the ear. This fountain, which never runs dry in summer and never freezes in winter, is a great convenience to the neighboring village and to all who have to go thither to mill and to meeting, to the store and to the post office. With very little loss of time the teams are watered. Unlike brook water, it is always at the palatable temperature, and never frozen. The whole expense of this public convenience could not have exceeded five dollars, and the cost of annual repairs is too small to be noticed. One other fountain was by a lovely road side nearly a half mile from the house of the farmer who put it up, on the road he had most occasion to travel. He had found that his horse might drink safely all the water he wanted if he travelled a half mile after drinking. It saved an extra trip to the stable after he reached home. All the money outlay for this public convenience was about eight rods of half-inch lead pipe, which brought the water from a spring into the trough. The labor upon the ditch and upon the chestnut log of which the trough was made would not bring the whole cost to more than ten dollars. In another case the water was brought from a brook in an open ditch, and turned into a half hoghead at the road side by a narrow trough. Not more than a day's labor was expended upon the job. The man who establishes such fountains as these is a public benefactor. He who makes a spring by the wayside, where none was before, has the charity which is twice blessed; it blesses the giver and all his beasts with perpetual refreshment, and the wayfarers of the present and coming generations will sing his praise. The statutes of this Commonwealth provide that any one who will construct such a fountain and keep supplied with water with the approval of the selectmen, shall receive three dollars annually. Oftentimes it would be a good investment for the farmer to provide this much needed public convenience, and draw the premium.

CONNECTICUT.

**Gapes in Chickens.**—"J. C. T.," Queens Co., N. Y., sends his experience with gapes, which is certainly very encouraging and illustrates the value of keeping the poultry, the coops, etc., in a clean state. "I have raised chickens for thirty years, and never lost one with the gapes. The disease appeared as soon as I began, but I had seen that wheat dampened and rolled in sulphur would cure it, and I tried it with entire success. Soon after, I had occasion to use a watering pot, kept in the hen house, and I became so covered with vermin, that I was obliged to take a bath immediately, and change my clothes. I set about a reform forthwith—white-washing the hen-house thoroughly, including perches, and nests, and sprinkling the floor with clean sand. When the chicks are hatched I burn the hay of the nest, and whitewash the nests again, which should always be movable—move the coops, which are also white-washed inside, to a new spot every day, keeping the hen cooped a few days, then let them run, shutting them up at

night. I had no idea of preventing the gapes; my efforts were only to secure cleanliness, since then, no chicken has gaped on these premises, and, of course, the older chickens are much improved in health and vigor, so that there has never been any kind of sickness among them. It cannot too often be repeated, and emphasized, white-wash—*white-wash*, in every nook and cranny, and clean out and put dry earth or sifted coal ashes under the perches frequently. I do not say there is not a worm in the throat, I have had no occasion to examine a chicken killed by the gapes, but I do say, no chicken kept free from lice ever had the gapes with me."

### Among the Farmers.—No. 57.

BY ONE OF THEM.

The labor market has been overstocked, in this section at least, for some months past, yet so far as I see, few of my neighbors have taken any advantage of it except to pay lower wages, which they are not slow to find out may be done. Very fair farm hands, good to work with others, and under a foreman, might have been hired at \$10, except just during the pressure of haying. I hired a very active Hungarian Slavach, or Slavonian, for those

Fig. 1.—MAKING A WITHE.

wages, and found him an excellent plowman and mower, and the handiest man with an axe I ever had on the place. He was discontented and restless, and needed constant driving and watching.

#### The Use of Withes.

The use this fellow made of withes was remarkable. He had evidently been accustomed to binding faggots, and would take any green branch, straight or crooked, entire or branched, and placing it beneath his foot, as in fig. 1, twist and manipulate it until it made, in a very short time, a complete rope. (See fig. 2.) He would combine several withes by knotting them, and so make a rope 15 or 20 feet long, and strong enough to bear the pull of two men, or even of a horse.

This making and use of withes is not new to me, but the extreme facility with which the man made more flexible and tougher ones than I ever saw before, out of all sorts of woody growths, set me at imitating him.

I have a great stock of Ozier Willows, which we use from preference, but when in the woods, or fields, white birch, hazel, witch-hazel, alder, and even cedar and wild cherry make excellent withes. The only "trick" is to get a uniform twist, which breaks up the integrity of the fibres of the wood. It may be twisted too little, and then will be brittle

Fig. 2.—THE FIBRES TWISTED.

and perhaps break, or be twisted too much, in which case it will be weakened by the breaking of the fibres. I had a lot of corn fodder which I bound with withes with great satisfaction.

There is a "trick" or two about the handling of these wither-bands that I was glad to know. Figure 3 shows a common twist given to the ends of the withes. The extreme butt end, it will be noticed, is bent at right angle to the twist, and this gives a

powerful leverage, by which the band may be very tightly drawn. In most instances there will be very little twisting of the butt end, but the smaller end will wind itself around the other. It does not matter if only at last, when the wither is fastened, we bend the butt end upon itself, and tuck as shown in figure 5. This will hold any ordinary strain, but when a very secure fastening is needed, the small end of the wither—very likely terminating in a bunch of twigs—is laid in after making one or two twists, as in figure 4, and caught in, when other turns are given. Then the end is tucked as in the other case.

Fig. 3.

#### Willows.

I am very glad I have plenty of Willows. My land is moist, a portion of it, and they grow rampantly, and they are very useful not only as withes, but for many other purposes. Were they more commonly cultivated, I think we would soon learn to make them as useful as do the Dutch and French and Germans. It is no unusual thing to see wagon bodies made of Oziers plaited together. Four pieces, having holes left where they may be fastened together, and to the stakes of the wagon, constitute the whole affair, durable, cheap, and capacious, for these wagon bodies are usually employed for light loads, as for leaves and for litter

#### A Question in Breeding

has lately interested me, and I have discussed it with some of my friends. Ought a breeder of improved stock of any kind, whose aim is to benefit himself, his herd, and the breed, to breed for the perfection of individuals or for the establishment of a family or families? We breed individuals of course, and every breeder's aim is to produce the best individuals possible. The question is, whether he shall be satisfied with immediate results, or only with the results in the long run. Outside a select list of Shorthorn breeders, there are very few breeders of any class of animals in this country, unless we include a group of game-fowl breeders, and perhaps some breeders of Light Brahmas, too, who have not been, judging by the pedigrees

Fig. 4.

of their animals, perfectly willing to ignore the family in their efforts to produce superior excellence in the individual by hap-hazard crossing. All crossing of diverse strains is hap-hazard. No one can tell how the cross will "knick." To be sure, the crossing of two totally distinct strains of blood, especially if they have strong good points which are inherited, almost always results favorably in the first generation. And the fact that still better results are usually gained by breeding the second generation back to the first, provided there is a fair foundation of constitutional vigor, indicates too clearly to be overlooked that great success in the future will be gained by breeding families.

What is a family? I regard it as a group of animals of closely related blood, and having similar characteristics. The animals look alike, possess similar qualities, have similar dispositions, and have similar constitutional tendencies. Of course the closer a family is bred the more these similarities prevail, and the more surely will they be propagated. In breeding neat stock and studying pedigrees, with reference to families, we encounter on the threshold a problem for which I have never met a solution: Which is the most potent, the in-

Fig. 5.—TIE COMPLETE.

fluence of the sire or that of the dam? The practice of Shorthorn breeders, if I interpret it aright, as well as that of Devon and Ayrshire breeders, is not to regard blood, no matter what the proportion may be, as admitting an animal to the distinctive name of the family unless it comes in the direct dam's line; and yet, every animal in the direct line is regarded as in and of the family. A "Constance," with say four "Duke" top crosses, although this would show that she has  $\frac{1}{16}$ th's Duchess blood, is not a Duchess and never can be. Yet she may have many or all the characteristics of the family.

Is this distinction well grounded? or is this way of considering animals as belonging to a certain family, because that is the line of their dams, erroneous and misleading?

I do not know that any man is wise enough to answer the question. It seems as if the blood of either parent ought to be potent in exact proportion to the closeness of its breeding. Among the Jerseys, for instance, we have what is called a pure "Alphea," that is an animal going back on every line to Alphea and Jupiter, her own brother—of course to Saturn and Rea, the parents of both. Now the question is, as brought down to practice, will a bull which has such a pedigree, crossed upon a cow of another family, or no family, impress his progeny with Alphea characteristics, more than a cow of the Alphea family with no out-cross, paired with a bull which is an entire "out-cross."

I think it is not too much to say that this very important question has never been answered. There are certain Jersey breeders, at any rate, who may, by a few experiments, settle this question permanently. They will do the country, and the world, a great service if they will. One man has a cow, another has a bull—a few have both adapted to test this. It is earnestly to be hoped that they will co-operate for the solution of the problem.

#### Cost of Raising a Milch Cow.

I have received the following note from "A Subscriber to the Agriculturist": "I declined to accept an Alderney calf of three months for the reason that there was no pasture ground on my four acres of country home. My neighbor says that the milk of two years will more than pay for the cost of fodder during the three years of minority, which I doubt. Can you give information as to the cost of raising a calf to maturity or maternity when all the food is purchased?"

This is a question upon which I would be very glad to have the results of the experience of other readers and subscribers to the *American Agriculturist*, but will briefly discuss the subject here. A calf at three or four days old is worth about a dollar. If it be kept until it is six weeks old, and fit for veal, it will consume six quarts of milk a day at least, and probably some oil-meal or corn-meal porridge besides. If milk is worth 3 cents a quart on the farm, that will be 18 cents a day for 42 days, and will amount to \$7.56. To this add \$1.00, the original value of the calf, and 50 cents, the cost of the meal used to supplement the milk it would have if it sucked the cow, and we have \$9.06 as the actual cost of the calf at six to seven weeks old, which is quite as much or a little more than it would bring if sold for veal. The profit of this transaction is only in making a market for milk at 3 cents a quart. We can raise calves, however, and even fatten them for veal, and make pretty good veal too, and feed only skim-milk, adding oil-meal, oat-meal, or Indian-meal—or best a mixture, in the form of well-cooked porridge. I calculate that this system is good enough for calves that we are going to raise, though I would not want to be set down as saying that a calf for veal ought to be fed better than one to be raised to maturity. My point is this: If we are going to raise the calf, it is turned into a paddock and has a free run a good part of each day; thus it can never become fat, and it is able to do well upon, and thoroughly to digest and profit by different food from a veal calf. We will say it receives six quarts of skim-milk a day, at a cost of 1 cent a quart, and that besides this it gets meal to the amount of  $1\frac{1}{2}$  cent a day,  $7\frac{1}{2}$  cents a day for 42 days being the cost of feeding. This makes, adding the \$1.00 original value, \$4.15 as the

cost of the calf at six to seven weeks old. If moderately fat, it will sell for \$7.00 or \$8.00, so we make a gain of some three dollars, besides the butter of 292 quarts of milk. I dispose of several

Fig. 1.—THE BENT AXLE.

calves a year in this way, and it often happens that the butchers or market men decline point

blank to believe that they have never sucked—and my calves never do suck a single day.

Now to raise the calf from this point is the rub. If we must buy all the feed and give it all it will eat, it will cost 15 cents a day for one year, or \$54.75, or say \$50.00 as the cost of a yearling. This is more than it is worth three times over, unless it be of remarkable blood and can be readily sold for that or for more, which is not likely. If we want to buy we shall probably have to pay as much as that, and it may be the calf or yearling we want will be cheap at \$100.00; but if we must sell we will find it very different. If the cost of feeding for the first year is \$50, that of the next year will be \$60 to \$65, and the cost of the heifer, when she is ready to calve, will be as follows:

Cost to the end of the first year.....	\$ 50.00
Cost of bull service.....	5.00
Cost of keep to the end of the second year...	60.00
	\$115.00

This is of course much more than a first-rate heifer can be bought for in the dearest market in this country. She will do exceedingly well if she yields 10 quarts of milk a day on an average for six months, making 1,800 quarts, and 4 quarts a day for the rest of the year, making 720 quarts, or 2,520 quarts in all. If this can be sold for 6 cents a quart, it will bring in \$151.20. The keep of the cow will be not less than 20 cents a day, or \$73.00, which, being deducted, leaves \$78.20 as the net earnings to be set off against the \$115.00 which the cow cost.

We must not forget that not one heifer in ten does as well as this, and also that not one heifer in a hundred costs so much at her first calving. Most people who want to raise a heifer can hire pasture

Fig. 3.—AXLE AND SHAFTS.

for young stock at about 25 cents a week. This will make a great deduction in the cost, namely of \$43.50. The heifer therefore would cost, if pastured six months in each year as proposed, only \$71.50, and if she should give the same amount of milk which we figured upon, and it could be disposed of to the same advantage, the milk of one year, to say nothing of the calf, would not only pay the cost of raising the animal, but give a net profit of \$6.70.

"Figures don't lie," but they do deceive wofully sometimes, and if anybody tries to carry out these results he will probably be disappointed. There are, however, thousands of two-year-old heifers which, if fed at a cost of 20 cents a day, would yield ten quarts of milk for six months.

It is a great satisfaction to have a nice heifer of one's own raising, which the daughter of the house has petted day after day, which the children have adorned with garlands of daisies, and one which is as gentle as a cosset lamb; so if the raiser will charge \$75 or \$100, to satisfaction, and credit the heifer with the same sum, the balance on the final trial will be found in favor of the pet heifer of the family.

Fig. 4.

2.—THE SHAFTS.

#### Hints and Helps for Farmers.

**A PORTABLE FEED BARREL.**—"Subscriber," L. I., sends a description of a Feed Barrel on wheels which he has used for a number of years, and claims "is the handiest thing I have on the place." An old buggy axle and wheels were taken as the basis, or running gear. The axle was taken to the blacksmith and bent into the form shown in figure 1. Shafts, fig. 2, were then placed on the axle and

Fig. 5.—THE BARREL CART COMPLETE.

fastened behind with a bolt, at each side, with an axle clip, fig. 3. An old pork barrel was furnished with two hooks, placed on the sides just above the center, as shown in figure 4. The shafts being passed through under these hooks, the affair is complete as in figure 5. "You can unload the barrel by throwing up the handles when the water or feed will run out, or you can slip the barrel off and take another empty one. I have three such barrels, two for swill, and one for water for cattle or the garden." The shafts may be held up by a leg.

**A MACHINE FASTENER.**—In a talk with an ingenious farmer the other day, we asked him if he had any way of securing his fanning mill,

Fig. 6.—A MACHINE FASTENER.

corn sheller, or other similar machines, to the barn floor. The method employed by him, is as follows: By means of two screws, a strap of iron (with the lower end turned up to form a hook), is fastened to the lower end of the legs of the mill, as shown in the engraving. When the machine is put in its proper place, it is secured in its position, by driving a staple of flat iron, *a*, with chisel points, over the hooked end of the iron, that is, upon the leg of the machine.

**A TURNIP PULLER.**—"Old Subscriber," Long Island, send a sketch of a Turnip Puller, shown in

Fig. 7.—A TURNIP HOOK.

figure 7. It consists of a double or pronged hook fastened to a long handle like an ordinary hoe. With it the person can stand erect and work rapidly and with comparative ease. "It will not cut or injure the turnips in the least. Once used one would never pull turnips by hand again."

**A RAIL HOLDER.**—"J. C. W.," Cromwell, Conn., is so much pleased with a Rail Holder that he has used for some time, that he sends a sketch of it

Fig. 8.—A RAIL HOLDER.

for the benefit of our readers who may have rails to sharpen. The rail is laid on chopping blocks, or logs, *A, A* (fig. 8), and held in place by three stakes: two

of them, *B, B*, about four feet long, and are driven firmly into the ground, four feet apart, alongside of the rail. The other stake, *C*, is driven between these two, and in a slanting direction. A lock-stick, *D*, is placed above *C*, resting against the posts, *B, B*, by means of which the rail is held firmly in place. When the rail is to be removed, lift out the bar, *D*, withdraw the stake, *C*, and the rail is loose and ready to be taken out.

**A SAFE GATE LATCH.**—"T. J. M.," sends a sketch of a gate latch, (figs. 9 and 10), which he has had in use for some years. It is very simple and is safe, as it cannot be pushed back without lifting, cannot be shaken loose by the wind rattling the gate, nor rubbed open by cattle or horses.

Fig. 9.—LATCH OUT.

**A HOME-MADE LEVEL.**—The accompanying engraving shows a level made by L. W. Smith, Luzerne Co., Pa., to whom we are indebted for a sketch and description. It consists of two pieces of glass tubing each about 5½ feet in length, fastened to registered strips of board, the whole resembling great thermometers. The lower ends of these two parts are connected by rubber tubing of any desired length. The whole is then filled with water up to the middle of the glass tubes. The figure represents the level placed on the top of two brick pillars. The height of the column of water in the left-hand tube, as read off on the graduated scale is 4.10 feet, that in the right-hand tube is 0.80 ft. therefore the right hand pillar is 3.30 ft. higher than the left hand one. With this instrument the foundations of houses may be made exactly level.

Fig. 10.—LATCH IN.

Fig. 11.—A HOME-MADE LEVEL.

It will also be of use in arranging mill shafting, laying long beams, floors of buildings, etc., etc."

**"Weathering."**—This term is often used among farmers, and is certainly a good one, as it expresses as much of the nature of the process as can be contained in a single word. When land is left without a crop, and is exposed to the action of the air and sunshine, the winds and rains, frosts and other natural agencies by which the original rocks, through long years, have been converted into rich soil, we say that it is "weathering." In other words, there is no crop to take up the nourishment as it is formed in the soil, and there is therefore an accumulation of these food materials in the soil, and it gradually improves by the process. The throwing up of the soil into ridges in the autumn, that there may be a greater surface

exposed to the weather, is an instance of winter "weathering," while fallows are the more common instances of "weathering" during the summer.

### A Spring Pen-Stock.

"T. S. B.," Schuyler County, N. Y., sends sketch and description of a method he has adopted for conducting water from a spring to a trough in the barn-yard. He writes as follows: "Having occasion to drain off a piece of flat land.

DIAGRAM OF SPRING PEN-STOCK.

overflowed from a spring, I dug a ditch from the spring which ended within a short distance of my barn. Before closing the ditch the thought struck me that I might provide for a constant supply of water for the stock in the barn-yard. I found the land so level that it would barely admit of getting the water into a trough above ground. I concluded to dig out the spring to a fair size and sufficiently deep to prevent the waste of water, and laid it up in cement, the water being allowed to escape only at the top. In the meantime I procured pump-logs to reach to the barn. The end of one of the logs was cemented near the top of the spring and connected with the others, which were laid, with a slight decline, to the pen-stocks in the barn-yard, as shown in the accompanying engraving. To prevent the overflow from the pen-stock from making a wet place in the yard, a hole was bored in the bottom of the trough and a pipe inserted, the upper end of which reached nearly to the top of the trough. The excess of water thus flows off and directly into a closed drain below. I have a full supply of water, brought over a nearly level field, and no water standing around the trough in the yard. A screen of fine wire should be placed over the end of the log at the spring, to keep out the mice that might otherwise get in."

### What is the Best Material for Drains?

The very best material for drains is not yet discovered; certainly it is not yet thoroughly tested. Many things have been tried in draining, both in this country and in the British Isles, that have failed. Rails, brush, plank, and cobble-stones will not make a permanent drain. Wood rots in time, and stone, without a culvert at the bottom, soon clogs, and the work has to be done over again. The common clay or brick tiles, now so generally used in this country, where draining has been introduced, answer a very good purpose where every tile is thoroughly burned and laid below frost. We have noticed recently in a pile of these tiles left over from a job of draining, finished several years ago, that they have crumbled more or less where they have been exposed to the weather. At the outlet of drains where the water does not run continually, the tile is disintegrated after a while, and becomes unserviceable. That waste which goes on at the mouth of the drain takes place more slowly under the soil, but it is only a question of time when some of the softer will crumble, and the water-duet will be clogged. To make a drain as lasting as the soil itself, we want something harder than brick, and, if possible, lighter. One great drawback to the use of brick tiles is the great expense of transportation. Glazed pottery tile, hard burned, made of fire-clay, or the poorer kind of potter's clay, affords a tile that is practically indestructible, and much lighter than the common brick tile. It costs a little more to manufacture, but is sold at the same price. When the lessened cost of transportation is considered, the glazed tile comes much cheaper to the consumer. These tiles are made in Ohio, and shipped to Boston, and sell in competition with the common brick tile. Of course they can be made profitably in any place

where the raw material exists, if there is a demand for them. The objection which arises from their impervious character is found to be no objection at all in actual use. Water enters the drain at the joints altogether, as it does mainly in the common brick-tile drain. The only advantage of the porous brick tile would be in soils so wet as to keep the drains always full of running water. The remedy for this would be to bring the drains closer together. The great advantage in the use of this glazed tile is that every tile is perfect, and practically indestructible by the action of water, or of such freezing as occurs three feet below the surface. A field thus drained would be a permanent investment for all coming generations. This material of which glazed ware is

made, though as durable as any, may not possibly be the cheapest for the manufacture of tiles. A glass tile made of the impure siliceous from which common black bottles are made, would be thinner and lighter than the glazed ware, and would be quite as indestructible. The sea-shore is an inexhaustible storehouse of sand, and it is very widely distributed in all granite regions. In this connection we have thought of the slag drawn off from the furnaces in a molten state, which is now mostly an encumbrance. If this could be run into proper molds as it is drawn from the furnace, it would utilize a generally worthless material, and make a tile as light and durable as glazed ware. C.

### A Smoke House and Ash Pit.

For an ordinary farmer's family a smoke house six feet square inside is large enough. If there is danger of frost heaving the walls, four oak or cedar fence posts may be hewed and halved together, to be partly bedded in the ground and to support the superstructure of bricks. Upon these foundation sills put walls seven feet high, capped with plates of two-inch planks. The rafters, set 14 inches apart, are notched into these and nailed to a ridge-pole supported by the brick gables. Thus there is no tendency to spread even if heavily loaded. The Ventilator in the roof is more for ornament than use. Hooks in the rafters support the meat. A wall two and a half feet high is placed across the smoke house inside, dividing the space, so as to make an ash pit four feet wide. This low wall is also capped by a plank, which should be built into the side walls. This forms a convenient standing place for hanging the hams. The door may be in the middle or at the side, the fire-place is set in the narrow entrance space. A flat stone, supported by two brick piers, makes as good a fire-place as anybody needs for smoking the meat hung to the roof above.

Fig. 1.—SECTIONAL VIEW OF SMOKE HOUSE.

Fig. 2.—GROUND PLAN OF SMOKE HOUSE.

entrance space. A flat stone, supported by two brick piers, makes as good a fire-place as anybody needs for smoking the meat hung to the roof above.

**Overfeeding for the Fairs.**—The practice of stuffing animals for a number of weeks and even months, for the sake of making them over fat and out of proportions for the Fair, is not only

a foolish but a ruinous one. One has but to point out the destruction that has resulted from this overfeeding in the famous Bates' and Booth's Shorthorn cattle, to show that a practice that will so deform and derange the animal as to render it either unfit or unable to propagate its kind, is wholly wrong and to be deprecated in the strongest terms. Judges at our Fairs should understand this matter and lend their whole influence to the side of a fair reasonable feeding and preparation for the Fair. Anything that is stimulated to an unnatural development should be considered only in the light of a monstrosity, and hold no place among animals that are competing for a prize upon the merits which they possess. The descendants of prize stock should be the best stock; but too often those who have bought prize animals have had only to regret it, because they were injured by overfeeding and took their prizes on artificial points, which were not hereditary, and they were therefore not able to transmit them to their offspring.

### Drawing Corn in the Shock.

It is frequently convenient to clear the corn-field soon after cutting, so that the ground may be

Fig. 1.—RIGGING FOR DRAWING CORN IN THE SHOCK.

plowed for wheat, or that the stock may be turned into an adjoining meadow, between which and the corn there is no fence. With their removal in view, the shocks should be made small and be firmly bound. It is best to use a wagon with a low, flat and wide "rigging," like that shown in fig. 1. This "rig" is made of four pieces of scantling, and four long, wide boards, put together as shown in the engraving. The wagon-reach should be let out more, and the rigging made longer than the one shown in fig. 1, in order to give more space between the wheels, an arrangement which will be found to

Fig. 2.—METHOD OF LOADING THE SHOCKS OF CORN.

be better. The method of raising the shocks upon the wagon is shown in figure 2. Three men are required for the most rapid and consequently the most economical loading of the corn. The wagon is driven quite close to the corn, and the man on the wagon throws a rope-noose over the top of the shock and draws it towards the wagon. At the same time the two "lifters" place a light, stout pole under the shock and lift it up, simultaneously swinging the butt of the shock out, away from the side-board of the rigging. One shock is placed lengthwise between the hind wheels, and the same at the forward end, after which the shocks are built up in the middle. The load will not be high, both because it will be heavy enough without, and for

the reason that it is not economy of labor to lift the heavy corn higher than is necessary to load it.

### Large Turkeys for Breeding Stock.

The common practice of breeding only from second brood turkeys, and those that are not fit to kill at New Year's, is a very short-sighted policy. In nothing will a good selection pay better than in breeding this noble bird. In the wild state where "the survival of the fittest" is the rule, gobblers weighing 40 pounds are not infrequent, and some are upon record weighing 50 pounds. The prevailing custom of breeding from the smallest and cheapest, keeps our markets full of birds that do not weigh more than eight or ten pounds. The birds that are known in the Boston and Providence markets as Rhode Island turkeys, run at least a third larger, and lots of dressed gobblers averaging twenty pounds can be furnished by the dealers at New Year's or later on very short notice. We know of one breeder who killed four adult gobblers last year that weighed, dressed, 126 lbs., or 31½ each. In all the districts from which these supplies are drawn, the farmers have found that it pays to take extra pains with the turkey crop.

There has been a steady gain in the average weight of the flocks sent to market at the three great festivals for the last twenty years, and the limit of perfection in this bird has by no means been reached. A large bronze gobbler, the offspring of a pair weighing 62 lbs., that took the premium at the New York State Poultry Show, was brought into Eastern Connecticut three years ago,

and three large flocks have been raised from him, and nearly all of them have been sold for breeding stock. The unanimous testimony of breeders even in this district where large turkeys are common, is that their flocks have been greatly increased in size by this stock. Suppose there is only a gain of two pounds in the average size of a flock of one hundred birds, it makes a difference of two hundred pounds, worth forty dollars at the present price of poultry in Eastern markets. This is nearly all profit, for the turkeys get the most of their growth in the pastures and woods, and are only fed

freely six weeks before marketing. Why then do not farmers generally invest in better stock. The chief reason probably is the cost of the stock. It seems a large price to pay five, ten, or twenty dollars for a gobbler of extra weight, or for a hen weighing 15 to 20 lbs., though such a pair of birds would leave their mark upon the broods of a whole neighborhood, and add thousands of dollars to the value of the annual sales for years to come. The breeder of fine stock graduates the price of his birds principally according

to their rapid development and weight. They will vary in weight quite a good deal even in the purest bred flocks. Gobblers weighing 18 to 19 lbs. in December are common; a quarter of the flock may reach 20 to 21 lbs., and a few may add a pound or two to these figures. The extra price asked for the last two or three pounds seems unreasonable, and yet it is the cheapest part of the bird, for it is this which shows his better constitution and aptness to take on flesh and fatten. It is the same principle applied to poultry which has given such wonderful results in the breeding of Shorthorn cattle. The large, well-shaped gobbler, beautifully marked, and bred to hens of similar quality, will give you birds of good, strong consti-

tution that will develop rapidly and make the most flesh out of a given amount of food. The cheapest bird we ever bought was a young gobbler of this character, for which we paid twenty-five dollars. Scores of flocks and thousands of birds have descended from him, and he has left his good qualities upon every one of them, so far as our observation has extended. A seven months' bird of 3 or 4 lbs. extra weight is quite sure to make a 30-lb. yearling, and such a yearling gobbler is worth twenty dollars in any breeder's flock that understands his business. There is no bird among all our fowls more susceptible of improvement. \*

### Holder for Fire Wood

The accompanying engraving represents a contrivance for holding the blocks of fire-wood while they are being split. The holder is made from a fork of a tree, such as may be easily selected while one is chopping in the woods. A heavy piece of hard-wood plank is spiked upon the sawed ends of the forks. This

A FIRE-WOOD HOLDER.

forms an inclosed space, into which the block to be split is placed, and is there firmly held in an upright position until all the necessary divisions are made. A simple holder of this kind, if well made and stout, will last for several seasons, and save much stooping over and picking up of separate sticks while splitting the family fire-wood.

**A Cabbage Cutter.**—Mr. "J. H. S.," Erie Co., Pa., sends a description of a Cabbage Cutter which he has made, and used with great satisfaction. An old east-off shovel was taken and a triangular piece cut out of the blade, as shown below. The V-

A SHOVEL CABBAGE CUTTER.

shaped edge was then ground sharp and the implement was ready for use. "With one stroke the cabbage is severed from the stump, ready to be thrown into the wagon." Mr. S. says there is no patent on this Cutter, and all are free to make it.

**Turnip Experiments.**—It is certainly monotonous to grow the same crop on the same field for twenty or thirty years, but it is only in such monotonous that satisfactory answers can be obtained to some of the most important questions in agricultural practice. It is in the fact that Dr. Lawes has conducted experiments with several different crops upon the same plots for such a long series of years, and with great care, that the deductions coming from his work are of such value. The recent statement in regard to his turnip experiments are in point. He says:—"In 1845 the land taken into turnip experiments at Rothamsted, and manured with superphosphate of lime, gave 14 tons per acre of bulbs and 4 tons of leaves. It has been under experiments ever since, but no succeeding crop has been so large, and at the present time a full supply of potash, superphosphate, and other mineral manures, will not produce more than 4 or 5 tons of roots to the acre. It is therefore evident that at Rothamsted the stores of fertility accumulated in the land before the experiments were commenced have been exhausted."

### A Corn-Husking Bench.

A convenient bench to hold the corn while husking, is shown in figure 1. It consists of two poles of hard-wood, seven feet in length, to which legs

Fig. 1.—A CORN-HUSKING TABLE.

are attached by means of auger holes and wedges. The bench should stand about two and a half feet high, be well braced, and covered with thin boards as shown in the engraving. To load the shock the bench is turned down on its side, as in fig. 2, when the shock is grasped near the top, and the bench, with the shock, tipped back into an upright position again. Figure 3 shows the corn ready for the husker, who can stand at his work. A farmer who has used one of these benches will not return to the

Fig. 2.—THE TABLE TURNED DOWN.

old cramped method of husking upon the knees. Besides in muddy weather there is a great saving of fodder that would otherwise be badly soiled.

### American Natural Cements.

An interesting paper on American Natural Cements was read by Mr. F. O. Norton at the recent convention of the American Society of Civil Engineers, from which we select and condense the following: The principal deposit of magnesian lime-stone, valuable as a cement—occurs in Rosedale, Ulster Co., N. Y. This Rosedale cement first came into use in 1823 in the construction of the

Fig. 3.—THE SHOCK ON THE TABLE.

masonry of the locks, etc., of the Delaware and Hudson Canal. At the present time there is between a million and a million and a half barrels of this cement made and used each season. Rosedale cement develops great hydraulic energy in twenty-four hours after being mixed with water, and is at that time equal to the English Portland. After the first day, the Portland gains rapidly upon the

Rosedale up to the seventh day, when the difference between the two is the greatest. At the end of a month the strength of the Rosedale approaches quite nearly to that of the Portland, and the difference is continually reduced thereafter. In practice, these cements are not used pure, but are mixed with a large or small per cent of sand, which reduces the strength of the mixture in the following manner: One part of sand gives mortar one-half as strong as the pure cement; two parts, one-third as strong; three parts, one-fourth; four parts, one-fifth; five parts, one-sixth. With the Rosedale, the reduction when mixed with sand is somewhat less than in the case of the Portland. The strength of Portland cement mortar, one of cement to two of sand, at the end of six months is 224 pounds to the square inch. The Rosedale in the proportion of one of cement to one of sand at the end of the same time is 257 pounds to the square inch. This being the case, it is shown that the mortar of the Rosedale, equal parts of cement and sand, is 34 pounds to the square inch stronger than the foreign cement, used in the proportion of one to two, and 54 cents per barrel less expensive. The last question is whether the Rosedale, one to one, is strong enough for all practical purposes to which a cement is applied. All the important masonry in America for the last fifty years has been laid in the American cement, and the fact that it has given perfect satisfaction for light-houses and culverts, sewers and bridges, in the water and out of it, shows that it meets all the cases where a good, strong, cheap, and lasting cement is required.

### An Archway Shelter Through the Straw Stack.

With winter comes the piercing winds, the intense cold, and, unless well protected, the greatest suffering that the farm animals experience during the whole year. It is the season when to keep the stock warm is no less a matter of economy than to keep them well fed; in fact, they are fed in a great measure to keep up the animal heat, the food serving much the same end that coal does to the furnace. This being true, it is reasonable to infer that an animal will require less food to maintain the proper temperature of the body were it warmed in part by other means. The inference is a true one, as thousands of experiments show—in fact, it goes without questioning that farm stock, when sheltered from the cold of winter, require a considerable less food to keep them in a good, thriving condition, than do those animals that are continually exposed to the weather. Shelter then has much more in its favor than simply the humane side, which alone is enough to warrant the comfortable protection of animals. There is an appeal to the pocket as well as the sympathy in the lowing of the shivering herd. All farmers, and especially those in the newer portions of the West, do not have stables for their cattle or snug sheds for their sheep. They are called upon to make the winter as comfortable as possible for their animals, with the limited means at their command. Sheds of poles with roofs of straw are extensively used and with profit. Not long ago we saw an archway shelter, under, or through a straw stack that was evidently an inexpensive and valuable device for stock protection.

The "ground plan" is given in fig. 1, and consists of two rail pens, of the ordinary sort for the bottoms of small stacks, placed near enough together so that an archway of poles could be made between them in the manner shown in the engraving.

The lower end of each pole was set a short distance in the ground, rested near the middle on the top rail of the pen, and crossed with its neighbor pole from the other pen, and was fastened to it with wire at the top and also to the rider. Over this structure the straw stack was built, and when finished had the appearance shown in fig. 2. In this way a snug shelter of considerable size was made beneath the stack under which the cattle gladly took refuge in stormy weather. The structure is a permanent one, the rails and poles re-

Fig. 1.—PENS AND FRAME OF ARCHWAY.

maining if necessary from year to year, or if taken down, to be rearranged again in a short time just before the thrashing is done. Such an archway shelter would not be out of keeping in many a well-kept barn-yard. If the stack is a long one a double archway may be made, and each will save many steps in doing the work of the barn-yard.

### Well Seasoned Fuel.

Most farmers use wood for fuel, and the best time to chop, haul, prepare, and pack it under cover, is in the comparative leisure of the winter months. There are several reasons for this. One good reason is enough, but we have four. It is a great saving of fuel. By drying the wood, most of the water is expelled, and there is little loss of heat in drying it as it burns. It costs about \$2 to work up a cord of wood for the stove after it is hauled to the wood pile, and it makes a difference that any one can calculate, whether a cord of wood

Fig. 2.—THE ARCHWAY UNDER THE STACK COMPLETE.

burned green, lasts twenty days, or burned dry, lasts thirty days. The use of well-seasoned fuel makes a large saving of time and labor, and on this score alone it pays to always have dry wood. It is a long job to light a fire with green wood, even with the help of paper and shavings. This work has to be done in the morning, when time is most valuable, either for sleep or in getting an early start for the work of the day. It is about an hour before the green wood gets dry enough to burn, and the fire ready for cooking the breakfast, warming the room, or both, a delay which is not at all satisfactory to any one. The wife or housemaid may be tempted to use kerosene to start the fire, and

too often gets severely burned, if not killed. The loss of an hour every morning, with hired men waiting for breakfast, makes a big figure in the course of a year. Look at it. Then the habit of preparing a year's stock of fuel in the cold months cultivates forecast, and is in keeping with other good habits, such as preparing for seed sowing, getting tools in order, cultivating and harvesting, all in due season. These things tell in the bank account. And lastly, dry fuel has an intimate connection with the serenity of temper and happiness of the household.

Fig. 1.—FIRST ROOTS OF POTATO PLANT.

It makes all the difference in the world with one personally, whether the woman who sits opposite him at the table, pouring tea and coffee, is made a spitfire by her daily tussle with sissing firebrands and soggy wood, or a saint by the use of seasoned fuel. It makes a great difference with the children and the servants. We are sceptical on some points, but have full faith in the use of dry fuel as a means of grace. It is not often the theme of pulpit discussion, so we drop a word here at the hearthstones of our readers: Remember there is a limit to "the patience of the saints," and burn dry fuel.

### The Roots of the Irish Potato.

Last month, page 344, Professor Atwater gave our readers a short chapter on the roots of the Indian corn, accompanied by a series of illustrations, engraved from photographs taken by a German investigator, Dr. Thiel. We here show four different stages in the growth of the roots of the potato plant, by engravings taken from the same source. These illustrations, being from nature, show as accurately as can be, the position, number, etc., of the roots of the potato plant. Figure 1 represents a potato that has been in the soil long enough to have the young stems well started, and the slender roots growing from their bases. In fig. 2 the roots have greatly increased in number and

Fig. 2.—YOUNG POTATO PLANT WELL ROOTED.

length, filling the soil with a network of fibres. Figure 3 gives a later stage of the potato plant, the photograph being obtained by first removing the soil from one side of the plant with great care, to not either break or displace the roots, and then photographing the plant, with the parts thus exposed. It will be seen that the roots are long, slender and very abundant, extending over a much greater area than the tops. The last stage, shown in fig. 4, gives the potato plant after it has finished its growth. The tops having completed their growth are comparatively leafless; the new potatoes are full grown and in a cluster upon short underground stems, at the base of the plant, and the fibrous roots, having fulfilled their office, have mostly disappeared, only

the larger ones showing in the photograph. The whole economy of the life of the potato is here shown. In the first place we have the tuber, the old potato, a store-house of starch and other nutritive material. When placed under proper conditions, the nutritive matter within the potato is expended in producing stems and roots—that is in establishing new plants, which are soon able to take up their food from the soil through the numerous fibrous roots. These contribute to an abundant growth of tops or vines—the above ground part of the plant. When the vines are sufficiently developed, they make preparations for continuing their kind; at their base, there start several underground stems—not roots in any sense, but as much stems as those above ground, but having no need of leaves they are leafless. Soon these stems swell at the end, from the deposition of starch and other nutriment prepared by the foliage; this deposit continues, the end of the stem is enlarged by its accumulation, and finally we have a cluster of ripe potatoes like the one with which we started.

### Liquid Manure.

One of the most successful gardeners we know of, uses liquid manure largely. He has a large tub, a discarded whale-oil cask or sugar hogshead will do, holding several barrels, sunk partly in the earth, near the middle of his vegetable garden. He has a cheap trough, made by nailing two four-inch strips together in the shape of a V, to conduct the water from his sink spout into the tub, whenever it is needed. It is not far from the well, and extra water is run from the pump into the tub, whenever it is needed. Into this tub all the slops from the chambers are emptied during the summer. Another line of cheap troughs conducts the liquid manure from the tub to any desired part of the garden. With a long-handled dipper, he stands at the tub, and waters the growing vegetables, and fruit trees, as their wants demand. He always has fine fruits and vegetables. When a house stands several feet higher than the garden, the tub or vat for holding the liquid manure can be kept wholly above ground, and the water be drawn off by a plug at the bottom of the vat. This will save the labor of dipping. The results of using liquid manure upon growing vegetables are quite astonishing. If the garden is large, and the wastes of the house are not sufficient, it is easy to increase its quantity by placing a few pounds of guano in the vat, and adding water from the well or cistern. The water should have the benefit of one day's sun, and be applied just at evening, or very early in the morning.

**How to Feed Beans.**—Beans, it is well known, form one of the most nourishing articles of

diet that comes to the table, and the regular weekly appearance of the baked beans, generally on Sunday in New England homes, attests the high appreciation in which they are held. Beans are much

Fig. 3.—ROOTS OF THE POTATO PLANT AT TIME OF MOST VIGOROUS GROWTH.

more used in this country for human food than for our domestic animals. They do not take to them kindly, with the exception of sheep, which are very fond of them and their pods and stalks also. Villagers and farmers often have small lots left over from the winter stores, and are in doubt how to dispose of them. Pigs, hens, and cows will not refuse them if mixed with other food. The best method of disposing of old beans is to boil them

Fig. 4.—POTATO PLANT NEAR THE CLOSE OF THE SEASON.

until they are sufficiently soft, and then mix them with scalded Indian meal, or other provender, and use the mash for feeding pigs and poultry. They are excellent to make flesh and eggs; and, in this shape, the last remnants of the bean bag may be turned to profit in the pig-pen or poultry-house.

### The Striped Blister-Beele.

The advent of the Potato-beetle (*Doryphora*), seems to have driven out of mind the fact that we have always had potato-beetles, and in some years in respectable abundance. There are several species of the genus *Lytta* that infest the potato and kindred plants. These insects are related to the European Blister-beetle, known as the Spanish Fly

ing the vines as they go. Though the insect can fly, it prefers, especially after a full feed, to walk, and if the driving be not too rapid, nearly all the insects in the field can be made to take up their march toward the windrow. If the operation is carefully performed, nearly the whole number of insects may be made to collect in the straw as a resting place, which is then to be fired; thus large numbers of them may be destroyed without the use

*purpurea*; there is another and a narrower-leaved species, both being found in the Western and Southwestern States. Under the name of "Black Sampson" the root is used by the herb doctors, but it is not employed in regular practice. Like many other perennials, this, in order to produce the best effect, should be undisturbed for several years. In rich soil it will soon make a strong and vigorous clump, and may stand by itself or be

THE PURPLE CONE-FLOWER (*Echinacea purpurea*).

BLACK-CAP RASPBERRY—THE "GREGG."

or Cantharides, and are said to possess similar blistering properties, although they have never come into general use as a vesicating agent. During the present season we have received numbers of potato insects to be named, all being the Striped Blister-beetle (*Lytta vittata*); this seems to have been especially abundant throughout the Middle States, in some cases proving quite as destructive as the "potato-bug," as it destroyed all the foliage, and that could do no more. But this Blister-beetle, unlike the other, is most destructive in its perfect or beetle state; indeed but little is known of the larval or grub state of this insect, beyond the fact that it passes its existence in the earth and probably feeds upon small roots. The engraving shows the general form of these Blister-beetles; some are black throughout, others are gray, one has a light margin to its wing cases, while this one has both a marginal and a slender central stripe on each wing case; the colors being light-yellow and black.

STRIPED BLISTER-BEELE.

These insects may be poisoned with Paris Green and London Purple, but it does not seem to be so effective with these as with the regular potato-beetle.

The best method of disposing of them, when they are abundant, is to drive them from the field. A windrow of straw or litter being placed at one side of the field, several persons, each armed with a leafy brush, march through the field abreast, beat-

of poison. A repetition of this operation will so clear a field of the insects that the few which remain will not be notably destructive. Should the other species occur at any time, a similar treatment will be found effective for them. It is said that this insect prefers all other varieties of the potato to the Peachblow, and that they will not touch the vines of that if any others are in the neighborhood.

### The Purple Cone-Flower.

Much nonsense has been written about prairie flowers. The majority of the flowers of our western prairies are coarse and belong mostly to the Family of the Sunflower and, like that, are in a large majority yellow. Most of the Cone-flowers (*Rudbeckia*) are yellow, but there are two purple ones separated from *Rudbeckia* and placed in a separate genus, *Echinacea*, a name which has reference to the hedge-hog character of the disk of the flower. The engraving shows the flowers of nearly the natural size; the center of the flower at first is rounded, but soon becomes pyramidal and pointed. This portion is of a dark maroon color, while the rays are of a light rose purple. The general aspect of the plant is that of the *Rudbeckias*. It forms a very ornamental plant in cultivation, but on account of its large size, growing to the height of four feet or more, is only suited to wide borders. A clump standing by itself is very effective. It blooms in July and continues through the summer. The species here figured, is the *E.*

combined with other tall growing plants of similar character, and produce a very pleasing effect.

### Black-Cap Raspberries.—The Gregg.

There is perhaps no fruit about which tastes so much differ as they do with respect to the Black-cap Raspberries. While many prefer them to the red varieties, others find them positively disagreeable. They belong to a different species from the red varieties, and are as unlike in flavor as they are in color and general appearance. The black varieties are derived from *Rubus occidentalis*, often called Thimble-berry, which is found wild and, in the Northern States at least, extends entirely across the Continent. It differs from the common native red species in propagating itself by rooting at the tips of the long curved branches. Of this species there are many varieties in cultivation, some of them showing but little improvement over the wild fruit. Among the newest as well as the finest varieties of this class, is the Gregg, which is said to have been found growing wild on the farm of Messrs. R. & P. Gregg, in Ohio County, Indiana. This variety, as we have seen it on the grounds of Mr. E. P. Roe, is certainly very superior in size, productiveness, and the quality of the fruit, to any other black-cap that we have examined. With rather an aversion to fruits of this class, we find the Gregg quite acceptable; it is more juicy, and the seeds seem to be smaller than in any other. The engraving, which is from a photograph of a

cluster from Mr. Roe's grounds, is of the real size. So far as we are aware, all of the cultivated varieties of this raspberry have been found wild. If there have been any attempts to improve it by cultivation, we have not heard of them. Sometimes, as with the Blackberry, albino, or whitish forms of this fruit are met with, and there is a set of yellow-eaps, but none appear to have become popular.

### Notes from the Pines.

Whoever has occasion to pass the broad brackish marshes, or "meadows," as they are called, which lie near New York City immediately west of the Hudson, is attracted by the great abundance of large Hollyhock-like flowers of the Rose-Mallow; it is the Swamp Rose-Mallow (*Hibiscus Moscheutos*). The appearance of these flowers indicates that mid-summer has come. In their wild state they present considerable variety, the usual color being rose-pink, varying greatly in depth of tint, and occasionally a white one is seen. Usually the white varieties have a purple spot at the base of their flower, but one of my neighbors was so fortunate as to procure one which was white throughout. Even the ordinary form is desirable as a garden plant, and with the white varieties a pleasing group may be made. We have received as *Hibiscus flavescens*, what is probably a marked form of this plant. The stems in this are purplish, the leaves much narrower, and the flowers before opening have a very light yellow tinge, scarcely perceptible except by contrast with pure white. When transferred to the garden, the Rose-Mallow grows much taller than it does in its native marshes, and is really a desirable plant in places where there is room for so large a clump as it will make. This plant illustrates a point that I have often mentioned, namely: that plants taken from wet grounds, and which in their wild state are never found in any other situation, are greatly improved by being transferred to the dryer soil of the garden. A remarkable instance of this is afforded by the common

#### Cardinal Flower (*Lobelia cardinalis*).

Some roots of this, taken from a swampy meadow and brought into the garden only a few rods away, are now (Sept. 1st) in full bloom with their strong, vigorous stems at least four feet high, and with a spike of its intensely scarlet flowers of a size that I have never seen equalled by the plant in its native localities. The Cardinal-flower is common all over the country, and illustrates the fact that to make a showy garden, one need not of necessity be at an expense for plants, as one with a little industry and observation, can find among our native plants sufficient to stock a large garden in a manner that will leave nothing to be desired in the way of beauty and variety. But few persons, even those who live in the country, seem to be aware of the great beauty of the wild flowers about them, and it is only when they have been brought into notice by florists, and a price is put upon them, that they seem to be appreciated. Not only are these wild plants increased in size and beauty by being placed in garden soil, but their period of bloom is often wonderfully lengthened. The common Bird-foot Violet (*Viola pedata*), when left in the fields has its time of flowering and is done with it, but in the garden it remains in flower all summer long. To be sure, this late bloom is not so abundant as the earlier one, but one can hardly go to a clump of these plants in a garden, without being able to gather flowers from it.... It is but a few years ago that we were gladly paying a dollar for a small plant of a new grass,

#### The Japanese Striped Eulalia.

Some plants when they get common are apt to lose in our esteem, not so with this beautiful grass. I saw not long ago in the grounds of Woolson & Co., a row of this grass nearly two hundred feet long; it was as tall as one's head, and presented a bank of variegated foliage that was most pleasing to behold. Indeed it was as much handsomer than the little plants, as the mass was larger. Aside from the beauty of this in the garden, its flowers are among the most desirable for grass bouquets, but in order to have them at their best, they should

be gathered very early; in fact, before the flowers are fairly opened. This early gathering of the flowers of grasses is a matter worth attending to by those who would make use of them for winter ornaments, and I think that it is one secret of the great superiority of California Pampas-Grass plumes, as they have a softness and brilliancy wanting in those that have been exposed to the weather.

#### Grasses for Winter Bouquets.

The Ravenna-Grass (*Erianthus*) that, in our severe climate, is the best substitute for Pampas-Grass, which is not to be depended upon in the latitude of New York, has its flowers vastly improved by this early gathering. I have found that by opening the sheaths which surround the clusters, and thus anticipating the natural period of blooming, that the flowers are not only more plump, but they are of much better color than when allowed to open naturally, and the same may be said of the flowers of the common Reed (*Phragmites communis*) of our marshes. By taking the flower clusters of this very early, the down of the flowers remains fast, and obviates the annoyance which ordinarily results from its shedding the down when thoroughly dried in the warm air of our dwelling rooms.

In the matter of ornamental grasses, too, one need not resort to exotic plants to get a pleasing variety. The Reed is often found in almost all marshy districts, while in dry and sandy localities the Tall Panic-Grass (*Panicum virgatum*), is abundant. This also greatly improves in cultivation, and its light and graceful flower clusters add a finish to a grass bouquet which cannot be imparted to it by any other species. With these two, and several smaller grasses, all taken very early in bloom, one can make a very handsome ornamental cluster. In drying grasses for winter use, it is, as a general thing, better to hang them up with the tops downward, and they should always be placed where they will not gather dust. In the abundance of

#### New Lilies from Japan,

and elsewhere, we are accustomed to look upon some of the old garden favorites as coarse and common. Indeed the old Tiger Lily is now seldom to be met with, yet for making a mass of brilliant color, what is more desirable? Better than the common form of this lily, is the variety called *splendens*. This has more compact flower-clusters, the plant is more robust and erect than the common kind, and a mass of this seen against a background of dark foliage is most striking. The Double Tiger Lily is very effective in producing a color effect, but it should be seen at a distance where the raggedness of the individual flowers will not be noticed. In passing a Broadway florist's store the other day, my attention was arrested by

#### A Mass of Pure White Flowers,

which at first sight I did not recognize. Upon closer inspection I found they were that form of the common Japan Lily (*Lilium speciosum*), known as the variety *precox*. This, which is not so common as it should be, has rather smaller flowers than the ordinary form, is more regular in shape, its petals being symmetrically recurved, and of a pure white. Those in the florist's windows were disguised by having the anthers removed, a precaution necessary with all light colored lilies, at least when they are to be shaken about or transported, else the dark brownish pollen which is so copiously produced, will fall upon and greatly disfigure the petals. This variety, thus treated, is admirable for use in large floral decorations, and I know nothing which gives so large a mass of pure white and is at the same time so delicate in texture as this. This variety is equally hardy with the ordinary kind, and although it is called *precox*, I cannot see that it is (as its name implies), any earlier, even if quite so early as the other varieties of lilies.

I think that the *American Agriculturist* was the first to bring into prominent notice that variety of *Lonicera Japonica*, the Japanese Honeysuckle, known as

#### Hall's Honeysuckle.

It is a satisfaction to have a plant as well as a person, on better acquaintance, fulfill its early promise; this Honeysuckle improves with every year's acquaintance. It grows rapidly, it climbs high, it has good foliage, it blooms early, and it

blooms all the time, its flowers are fragrant, and—what more will you have? I know that some people will find fault because its flowers are not red or of some other color than the delicate white they have at first, but until somebody can make a honeysuckle to order, I shall stick to Hall's.

### Staying Over-Loaded Fruit Trees.

The apple trees are breaking down under their loads of fruit. It is not worth while to let them. Tarred rope yarn is cheap and strong. One strand will hold a man's weight, and that is more than several bushels of apples. If, in applying the cord, you distrust a single strand, take two or more. First attach the cord to the lower limb, then draw it over an inner, upper crotch, place the toe of one

METHOD OF TYING OVERLOADED TREES.

foot under the limb, and lift it up a little, tighten the cord, not taking too much weight off the limb, and make fast with two half-hitches to the upper limb or crotch. Proceed in this way with every over-burdened limb which you can get at, and you will find the tree much better supported than it would be by poles. The accompanying cut shows the principle upon which this staying is done, so that one part of the tree shall support another.

### An Excellent Early Squash.

The early or summer-squashes are, as a general thing, very poor in quality, being coarse, watery, and flavorless. This spring Mr. Gregory, of Marblehead, who has a way of introducing fine squashes, sent out a variety called the "Essex Hybrid," which is claimed to be a cross between the Turban and the Hubbard. Of the quality of this squash Mr. Gregory spoke very guardedly, as he had not cultivated it himself. He sent us some of the seeds for trial, and we found it to be quite as early as the bush squashes and in every respect vastly superior to them. The squash has a remarkably symmetrical form, being somewhat like the Turban in shape, but more regular. Its skin is at first whitish or cream-colored, turning to orange, the flesh very thick, with but a small cavity for the seeds. In quality it ranks with either of its alleged parents, and well sustains the reputation of Mr. Gregory as an introducer of fine squashes. The vine, as with the winter varieties, needs a plenty of room.

### Ripening the Seeds of Trees and Shrubs.

—Sometime ago our valued correspondent, Jean Sisley, Lyons, France, sent to the "*Revue Horticole*" a hint which some may find useful in this country. If it is feared that the season may not be long enough to allow the seeds of trees and shrubs to mature, he cuts the branches bearing the seeds which it is desired to preserve while the fruit is still green. These he places in pots of soil, as if they were cuttings, keeping the earth properly moist, or in bottles filled with water. The pots or bottles are to be placed in a cool greenhouse, where the seeds will in due time come to perfection. This method will be found useful with berry-like seeds and others which the birds take as soon as they be-

gin to ripen. We have no doubt that some herbaceous perennials, that bloom so late that they rarely afford seeds, might be advantageously treated in the same manner.

### Planting Trees in Autumn.

Each year we are asked, "Do you approve of fall planting?" An answer, "yes" or "no," cannot be given to many questions asked us on such matters of practice. As to tree-planting, and also the shrubs that bear small fruits, it is only on our northern border, where the winter is prolonged at both ends, and commences with as much suddenness as it breaks up, that fall planting may not be done. Late October and early November are often the portion of the year in which out-door life is most enjoyable, and in which out-door work seems to tell better than at any other. Such golden days! Then the soil has not yet lost the warmth that it has been accumulating all summer, and to plant in it is like giving the trees bottom heat. It is rarely too dry, and if properly drained cannot be too wet. In proper tree-planting the fingers often do a part of the work in filling in among and around the roots, and it makes the greatest possible difference whether the soil be cold or warm. Some will admit every argument in favor of fall planting, but add as an insuperable objection: "If we get our trees in the fall, the leaves will be stripped." This stripping of the leaves is needlessly made a bug-bear. A nurseryman who regards his reputation, who expects his customer to come again, would not strip the leaves from his nursery trees, to their injury, if he could. Those who observe closely know that the preparation of the leaf for its fall is a most interesting operation. When the tree is in full growth, a leaf cannot be removed without some force; if pulled away in midsummer, it will be likely that some of the tender bark will come with it and a wound be left. Wait until the leaf has done its work, and examine it in October; there will be seen a distinct line between the leaf and the now ripened bark of the stem; a slight pull, or a lifting up as one would lift a pear to see if it was ripe, and away comes the leaf, leaving a clean scar, over which the process of healing has already commenced. When the leaf has completed its work and is ripe, it makes no difference whatever whether we remove it by a brush with the hand, or wait until the winds and rains beat it off. This matter of stripping of the leaves need give no anxiety, simply for the fact that the stripping cannot be done until the leaves are ripe and have nothing else to do. The roots of trees, placed in the warm soil in autumn, are not mere dead sticks stuck in the ground. A change and a certain growth is taking place. As an illustration of this, put a currant cutting in the ground in September; it looks only like a dead stick, but take it up in November, or just before the ground freezes, and the lower end will show a callus, and often small roots will have started, but the cutting is, to all appearances, dormant. So with trees. No matter how carefully they may be taken up, some roots will be broken and torn. If in planting in autumn we cut, as we should in planting at any time, every broken root back to a sound part, leaving a clean, smooth wound; in a short time these roots will begin to repair damages, and before winter checks all action, much will have been done towards overcoming the effects of removal. In the warmer States, anywhere south of 40°, in most years planting may continue the greater part of the winter without harm to the trees.

### The Nettle Tree or Hackberry.

There is no native tree of which so many specimens are sent to us for a name as of the Hackberry (*Celtis occidentalis*); although it is found in most of the states and territories, it seems to be no where abundant, and is but very little known even to those who are familiar with trees. In general appearance the tree is like the Elm, and belongs to the same botanical family, but it differs from the Elm in producing a small berry about the size of a pea. As found in the Eastern States, it is a tree of

moderate size, but further West, specimens are sometimes found 80 feet or more in height. As a tree for ornamental planting it is desirable, but it is not very valuable as a timber tree, as the wood is not durable when exposed to the weather. The shape of the leaf is shown in the engraving, which gives a twig with the leaves and fruit of the natural size. At one side are shown the very small flowers, which appear in early spring, in small clusters; some of them are staminate only, while others are perfect. The fruit, which, when fully ripe, is a blackish purple, has a very thin, sweetish pulp,

THE NETTLE TREE OR HACKBERRY (*Celtis occidentalis*.)

and is sought after by birds and also by children. Although the tree is so little known, it is remarkably well provided with names. Besides those already given, it is also known in different parts of the country as Beaver-wood, Hoop-ash, Many-berry, False-Elm; and in the Southern States it is called Sugar-berry and Sweet-gum, this last being a name also applied to other trees. The name of the French Canadians, *Bois inconnu* (unknown wood), would imply that it was little known to them. The tree varies so much in shape and thickness of its leaves in different localities, that four species have been described from its different forms, but they are all local modifications and are now properly so regarded. One peculiarity about this tree is, that one seldom finds it in groves or clumps; indeed it is rare to find two within a radius of many miles. George B. Emerson says: "The tree might be described to one who wished to be able to recognize it, as an Elm bearing purple, sweet cherries, which continued on the stem through the winter." According to Arthur Bryant, the most important use for the wood of this tree is to make the flat hoops of flour and fruit barrels. He says that it is sometimes sawed into lumber to use for inside work, but that its tendency to shrink and swell with the moisture of the atmosphere, makes it of little value. The European *Celtis*, on the contrary,

is much valued for the character of its wood, and is cultivated in some parts of France. Its long suckers are used for handles to hay-forks, to make whip stocks, ram-rods for muskets, walking sticks and carriage shafts, and the wood is a favorite with the wood carvers.

### The Treatment of Celery.

Those who have adopted the modern method of growing celery upon the surface of the ground, instead of placing it in trenches, often make a mis-

take in banking it up too early. If celery be banked up in growing weather, the central portion will continue to grow at the expense of the rest, and the consequence will be that the outer stalks are pithy and worthless. Celery intended for winter use requires no banking up where it grew, it only needs to have its stalks straightened up, by bringing some earth to them with the hand; this operation is known to gardeners as "handling." If this is not sufficient to keep the stalks upright, enough earth may be drawn to them with a hoe to hold them in an erect position. Celery will stand a moderate frost without injury, but hard freezing will kill it. Celery that has been straightened up, will, after a few days, remain erect, and be ready to put away for the winter. It may be stored in trenches, a foot wide, deep enough to hold the plants, and as long as may be needed. The plants are stacked in this trench as close as they will stand, and a covering of leaves, straw, or bog-hay is put over it—light at first, but increased as the weather becomes severe. For family use, a very neat way is that described in our columns a few years ago by Peter Henderson. Boxes are provided, about nine inches wide, of a

height a little less than that of the celery, and of a convenient length to handle. A few inches of sand or good soil is placed on the bottom of the box, and the plants are stood erect and close together, as in trenches. This method is practicable only in a cool cellar, and the boxes, if placed side by side, should be so far apart that there can be no danger from heating, which would spoil the celery.

"**Madeira Nut.**"—Mrs. "W. D. E." asks when to plant the "Madeira Nut." This nut is generally known as the "English Walnut," though the tree is not a native of Great Britain; but probably of oriental origin. We much doubt if the nuts, as they are found in this country, will germinate, as, like other nuts, they should be placed in sand or earth as soon as ripe, in order to preserve their vitality. They should be thus kept during the winter and planted in the spring. In Europe, where many varieties are known, the trees are grafted, in order to produce fruit of desirable kinds, much in the same way as with many varieties of fruit trees. If our correspondent only wishes to have a tree or two, it will be better to purchase them, as they are grown by the large nurserymen and kept by them for sale. In the Northern States they rarely produce fruit, but are productive in Virginia and southward.

## THE HOUSEHOLD.

For other Household Items see "Basket" pages.

### A Foot-Rest and Slipper-Box.

Most men like to put their feet upon a support that will bring them some distance from the floor, when they are to take the most solid comfort that a sitting posture can give. A rest for the feet

Fig. 1.—THE BOX.

makes a tired man more at ease. In view of this fact, and that chairs are not fitted for this foot service, but are liable to be scratched and injured, various kinds of foot-rests have been made, some of which are very elaborate and expensive. We have a foot-rest in use which we made ourselves, and though not in the highest style of household art, is at the same time neat and useful. It is made as follows: A pine box about 16 inches square was selected and taken apart. New lumber might have been used had it been at hand, and no old boxes in the cellar. The side pieces were sawed as indicated by the dotted lines in figure 1, and when brought together again gave the box a somewhat pear-shaped and pleasing outline. The bottom was then cut down and fitted in, and the cover fastened on by two, small iron hinges. This completed the new box, or foundation, as one might say. The covering was then put on, which may consist of any kind of cloth to suit the taste. The top, or cover, should be thoroughly padded, as upon this the feet are to rest. The sides may also be filled out a little, to give the whole a plump and pleasing appearance.

Finally, small casters are fastened on the bottom by means of which the Rest may be moved readily about the room. This Foot-rest serves a good purpose as a stool, and the interior of it is a handy place for putting away the slippers when they are not in use. In looks it is not objectionable as an article of furniture; but as a rest for the feet after a hard day's labor it is something that would be greatly missed if it should be taken away.

Fig. 2.—FOOT-REST, FINISHED.

### Are Your Closets Ventilated?

There is nothing so handy in a house as an abundance of large, roomy closets; but because they are handy and extremely useful they are apt to be abused. There are many things, which, as a matter of course, are always put into a closet, of which the articles of outward wearing apparel make a large part. There are also things which ought not to go into a closet, *i. e.*, a closet adjoining, or closely connected with, a living or sleeping room. Of such are all soiled under-garments, the wash clothes, which should be put into a large bag for the purpose, or a roomy basket, and then placed in the wash-room or some other well aired room at some distance from the family. Having thus excluded one of the fertile sources of bad odors in closets, the next point is to see that the closets are properly ventilated. It matters not how clean the clothing in the closet may be, if there is no ventilation that clothing will not be what it should be. Any garments after being worn for a while will absorb more or less of the exhalations which arise from the body, and thus contain an amount of foreign—it may be hurtful matter—which free circulation of pure air can soon remove; but if this is excluded, as in many close closets, the effluvia increases, and the clothes, closets, and adjoining

rooms in time possess an odor that any acute sense of smell will readily detect. Every closet in daily use in which the night-clothes are hung by day and the day clothing by night, should have an airing as well as the bed. If the closet can be large enough to admit of a window—and it is in some cases—an ample provision for sunlight and a circulation of pure air is provided in the window, which should be left open for a short time each day. In the case of small closets a ventilator could be put over the door or even in it. In many cases such precautions for pure clothing are not practicable, and the next best thing is, to see that the door of the closet is left open for a half hour or so each day, at that time when the windows are thrown up and the large room is purified with fresh air from out of doors. In this way: first, by keeping out clothes intended for the wash; and second, daily changing the air, the closets may be comparatively pure.

### Home Topics.

BY FAITH ROCHESTER.

#### Baby's Bow Legs.

These need not cause anxiety in all cases. If the child is healthy, and has good, nourishing food and pure air—the two great essentials for making good blood—it will probably outgrow its bow legs naturally enough as its strength increases. Rubbing the legs with your hand at night and in the morning may help to strengthen and to straighten them, holding them straight as you rub them. If the case is pretty bad, the two legs may be bound together with comfortable bandages during sleep, rubbing them well before and after binding them. If the child is still quite young, it may be kept from standing on its feet for a few months, giving Nature time to straighten the crookedness while the limbs are growing stronger. A carriage and a high chair are helps toward carrying out this plan.

All the things that I have mentioned as curative agencies may well be used as preventives. A healthy child, with wholesome food, and pure air to breathe, if kept from standing and walking while too young and weak, will not have bow legs. Scrofulous children are more likely to suffer in this way, and those that are very fleshy. Don't take pride in your *fat* baby. Excess of fat is really a disease, instead of a sign of health. Fatten your pigs as much as you fancy, but do not deliberately fatten your children. Give them plenty of good growing food, and they will be plump enough for symmetry and not too heavy for comfortable activity. It is no wonder that the little legs bend under the heavy weight of some fat little toddlers. Such children should not be encouraged to stand or walk until they have grown strong enough to do so of their own accord, and then should not be allowed to walk too much.

I hear of many cases where quite badly bowed legs have gradually straightened themselves without artificial help. Others think their children would never have outgrown the defect if they had not resorted to bandages or splints. Some have splints fitted to the ankles and bound around them, but I think it can be necessary to resort to this measure only in very confirmed cases. I have heard of one little girl who was very badly bow-legged when three years old, but had entirely lost the defect a few years later. Her mother began to rub and bandage her legs together every night, and kept this up a few months until a cure was wrought. It will not do to put a baby into a jumper too young, nor to let it stay in too long a time. Probably eight or ten months is an early enough age for this exercise. If the child remains too long in the jumper its legs become weary, and if not strong they bend under its weight.

They grow strong under the exercise, but they are liable to grow crooked also. A safer exercise, though not as neat and pretty, is creeping. This is Nature's way of strengthening the limbs preparatory to walking, and I should be sorry to have it omitted from the list of baby's accomplishments.

#### Wanted—Good Graham Flour.

A year ago the *American Agriculturist* told its readers that much of the graham flour sold throughout the country was a poor compound of

various mill stuffs, instead of the genuine "graham" of pure unbolted wheat meal.

"If it is bran that they want, give 'em bran," I heard a house-keeper say, who really did not care to have her family like the graham. This seems to be the motto of the millers also. I sifted some of their graham lately, and just half of the mixture that had been bought as "winter wheat graham" was pure bran, and very coarse bran, too. I am free to say that this is not what I want, and I am unwilling to give it to my children. In our Western cities and towns, where beautiful wheat abounds, and where the nicest of white flour is made, it is almost impossible to get genuine graham flour. I suspect that the "new process" of grinding works against the graham interest. The high grinding takes off a cleaner, coarser bran. Originally, we were taught to eat the bran because so much of the most nourishing part of the wheat—the gluten—was clinging inseparably to it. The bran by the new process is stripped so clean it is good for little on its own account except for those who need anti-constipating food. As waste matter, taken with other concentrated food, it keeps the bowels in good condition, and so is almost essential to people who have sedentary employments. The bran, to be sure, contains elements needed in the human body, but excellent authorities assure us that it usually goes through the body undigested, and if coarse and excessive, is apt to scour along with it nutritious material which would remain and nourish the body but for the mechanical action of the bran. I think it is best to sift out most of this bran, all of the coarse bran, if you are cooking for healthy people and children. Our sieves leave a deal of the fine bran and all of the gray gluten. It is aggravating, though, to be so swindled, and I think we ought to make a buzzing about the millers' ears. Examine their so-called graham, and you find that it is mostly bran and "shorts" (or "canaille," or "middlings"—three different names for the same thing, as I understand it,) with a little corn meal (usually the white kind), and a little cheap, fine flour. When this is the best I can get, I sometimes mix it with good white flour, half and half, thus diluting the bran enough to make it palatable. Even so, it is better than to live on white flour alone. Sometimes I sift half of the graham and add a little fine flour, and sometimes I sift it all and use it alone.

#### Mixing in the Bran.

I complained to a grocer lately of the branniness of his graham flour. He said others had found the same fault, and he "guessed the millers did put in too much bran lately!" as though bran had to be put into graham! Another grocer told me it was impossible for him to get better. He said that they could get what he called very nice graham, if the millers would let them go to the mill and take the wheat when first ground, before any bolting had been done. But the millers tell him that it won't do. They have to take an extra quality of wheat to make graham—something nicer than they use to make gilt-edged flour, probably! I feel like declaring emphatically that "I know better!" It happened to me once to live close beside an excellent mill, which ran its big machinery night and day, except on Sunday. I saw the freight cars left beside it every day and loaded with barrels of best quality, new-process flour, and shipped to Eastern markets. I had one sack of graham flour let down warm into the bag, just as it was ground, before it had passed a single bolt (or sieve), and this was the best graham flour I had seen in the West. There are first-class groceries, however, where such graham can be obtained, and we are usually so fortunate as to get it. Lately I have been sojourning in different places, and sympathized with the complaints of my friends.

#### Fine "New-Process" Flour.

I wonder if there has not been some mistake in the general abandonment of the old style of grinding. It costs an immense sum to put in the new-process machinery (to buy the patent or something), so that the very fine and white patent flour has a high price put upon it. This is what the millers seem mainly anxious to sell, and it is

praised up to us as more nutritious than the common "grade," or "straight," or "family" flour. They tell us it "goes farther" and is really cheaper than the "straight" flour, though it costs us considerably more than a dollar higher on the hundred-pound sack. From two men, proprietors of two different first-class mills, I have received testimony to the contrary. So I shall go on using the best straight or family flour. Here it is the "White Rose" or "Snow Flake," or these are the kinds I usually get, though I know there are others just as good. I fancy that light, sweet bread made of this really tastes better than the whiter bread, made of the finer flour, and I am convinced that we get quite as much, if not more, nourishment from it, while in our family it is a saving of at least \$10 a year—perhaps \$15—which would make quite a valuable yearly addition to our library.

There is no doubt, however, that this new-process "gilt-edged" flour is better in every way as food than the old-fashioned superfine flour, a flour equally fine and white, by the old process. The other was simply elegant starvation diet, as it contained very little except pure starch. By the new process of bolting the middlings, a much larger percentage of gluten is obtained, and this is the real muscle-making, strength-producing part of the wheat. As graham is compounded nowadays, it may be doubtful whether it contains bran and all, pound for pound, any more gluten than the fine flour. Were the great prophet of grahamism, Sylvester Graham, after whom unbolted flour takes its name, now alive, he would utter a strong protest against the use of his name upon the majority of the products that are now called "graham."

#### Grass Stain Removed.

I thought grass stain was hopeless. I have asked experienced people several times if anything would take the stain of green grass from children's clothes, but without gaining the desired information until within the last month. Lo! boiling water will remove the color. Pour boiling water through the stain and it sets the green coloring matter loose, rinsing it away. I tried it on a large stain upon the front of my little girl's white dress, and easily removed every trace of the grass, rubbing it a little in the hot water. Grass stain, after washing with soap-suds, makes a dirt-colored mark, and remains an ugly blot on children's white clothing.

#### Iron Rust Stains.

Squeeze lemon juice into a cup, add a pinch of salt, and rub the stain in this. Then wash in clear, tepid water. Sponge goods that cannot be rubbed. Lately I saw a black cashmere dress badly stained with yellow spots of iron rust, on the black silk trimming as well as upon the cashmere. The color was entirely restored by sponging with lemon juice and salt.—[With some blacks the matter would be made worse. A piece of the material having iron rust should be tried first.—EDS.]

#### More Mouse Traps.

"R. B. K.," Columbia Co., Wis., has tried several devices or traps for catching mice, and finds the one that he has contrived himself the best of them all. Our Wisconsin friend's trap is shown in figure 1, and is a "dead fall," so made as to do away

Fig. 1.—DEAD-FALL TRAP.

with the uncertainty of catching the mouse when the ordinary "figure four" is used. The trap is made of two boards 8 inches wide and a foot or so

in length, fastened together at one end by a leather hinge. A slot is cut in the middle of the bottom board for the spindle to rest in. A piece of lath with a hole in one end for the passage of the spindle, is nailed on one end of the bottom board. The other parts are arranged as in the engraving, which shows the trap set. The bait is placed on the end of the spindle near the center of the bottom board.

Fig. 2.—GOBLET TRAP.

goblet to fall. A piece of meat is crowded into the thimble, so that it can not be reached by the mouse until he has passed under the goblet, when by its nibbling the thimble is moved, the glass falls and the mouse is caught. This description came from a lady whose letter and address, we regret, is not at hand.

#### Grasses for Decoration.

A bouquet or vase of properly dried and tastefully arranged grasses of the more graceful sorts, is a very pleasing decoration for the parlor or sitting-room in winter. The beauty of a grass depends largely upon the delicacy of its flower clusters, and their graceful and orderly arrangement in the panicle or "bead." As a type of beauty among the larger grasses, a long feathery plume of the Pampas Grass may be chosen, and indeed it is a very pleasing object when preserved of its original shape and color. We must here enter a protest against the violation of nature by dying the plumes of grasses any color whatever. They, to our taste, can not be improved upon by being colored a deep crimson, an unnatural green, unpleasant black, or any other color. Grasses for their greatest beauty should be gathered just as they are fully in flower, and hung up or spread out to dry in a place that is free from dust. If a grass is gathered after it is beginning to mature its seed, the floral parts will become brittle and soon fall to pieces, and fail to be the objects of beauty that they would be if gathered when just at the opening of the flowers. There are a number of native grasses that are worthy of a place in such a collection. In general, it may be said that any grass that is attractive for its delicacy, grace, and color while growing in the field, will not be disappointing when it is tastefully arranged in the house.

**Chapped Hands.**—The raw winds of late autumn often produce in the hands of those who are much exposed to them that roughness and cracking of the skin known as chapping. If nothing is done to prevent, and the person is obliged to have his hands frequently wet and dried, the cracks will often get deep and be painful. Corn husking is frequently accompanied by sore hands from this cause. As both a precaution and cure for chapped hands we have used the following with benefit: Wash the hands, and the face also if it is inclined to chap, with Borax Water, and afterwards rub with an ointment made by melting Mutton-tallow (or suet), and then gradually adding an equal quantity of Glycerine, stirring the two together until cool. For the hands, this mixture can be best applied at night, using it freely, and warming it in by the fire, after which an old pair of gloves can be put on to keep the hands from being soiled, and also make the skin of the hands softer. An excellent Glycerine ointment for chapped hands is made by melting, with a gentle heat, two ounces of

Sweet Oil of Almonds, half an ounce of Spermacetti, and one drachm of White Wax. When melted, remove from the stove, and add gradually one ounce of Glycerine, and stir until the mixture is cold. The ointment can be scented with any perfume to suit the fancy. Keep in wide-necked bottles.

#### Household Notes and Queries.

**ENTERTAINING COMPANY.**—The whole philosophy of hospitality is summed up by Emerson in the following: "I pray you, O excellent wife, not to cumber yourself and me to get a rich dinner for this man or this woman, who has alighted at our gate nor a bedchamber made ready at too great a cost. These things, if they are curious in, they can get for a dollar at the village. But let this stranger see, if he will, in your looks, in your accent and behavior, your heart and earnestness, your thought and will, what he cannot buy at any price, at any village or city, and which he may well travel fifty miles and dine sparingly and sleep hard, in order to behold. Certainly let the board be spread and the bed be dressed for the traveller but let not the emphasis of hospitality be in these things. Honor to the house when they are simple to the verge of hardship, so that the intellect is awake and sees the laws of the universe, the soul worships truth and love, honor and courtesy flow into all deeds." One of the greatest comforts of having a home, should be that in it we have a place for friends and even strangers—rooms, more than supply the needs of the family and extra "leaves" to the extension table. The secret of true hospitality, as Emerson has stated, is in its coming from the heart.

**A HOUSEHOLD PRESS.**—A subscriber from Kansas sends sketches and descriptions of a household

A HOUSEHOLD FRUIT PRESS.

press for obtaining the juice from small fruits and for other uses, which he has employed for some years. A hard-wood plank 30 inches long and 11 inches wide serves for the bottom. A hole six or seven inches square is made in the plank near its middle. The plank is raised upon four legs, and a box fitted into the hole, as shown in the accompanying engraving. An upright piece is fastened at one end of the base piece, and to the upper end of this a lever is pinned. The lever carries a "poulder," the head of which is square and just fits into the upright, perforated fruit box. In using the Press the currants or other fruit are placed in a strong cloth and afterwards in the box, when the lever and poulder is brought down and the juice is quickly and thoroughly expressed.

**A POT OF ENGLISH IVY** makes one of the most agreeable and cheap ornaments for the sitting-room in the winter. A common four, or five-inch pot with a strong plant can be bought of the florist for fifty cents or less. It is easy to make a basket of interlacing coarse wires to hold the plant.

## BOYS &amp; GIRLS' COLUMNS.

## The Doctor's Talks.

We have been for a while somewhat off of our regular track, and have talked about insects and other things, but now that the weather is getting cooler and the evenings longer, we feel more like reading those things that require some thinking about, let us get back to our talk about Matter. Heretofore we have talked about solid substances, and I mentioned at the beginning, that we know of matter in three states, solid, liquid, and gaseous. Do you ever think of the difference between a solid and a liquid? How would you define it? Perhaps you would say that a solid stands by itself, while a liquid requires something to hold it; and that would be a very good definition. But to go back to some of our earlier talks; you recollect that it was stated that all Matter was supposed to be made up of minute parts or atoms. Not that any one has ever seen these, because they are too small to be visible by the most powerful microscope; but all reasoning shows that these really do exist. You will still further recollect that it was said that these atoms were held together by a force called Attraction or the Attraction of Cohesion. We know that this force is very great in steel, as we cannot break it or overcome the force of attraction, without great trouble. But a lump of sugar is readily broken. The attraction between the particles of steel or atoms of steel is much stronger than between the atoms of sugar. In solids we find every degree of hardness, and hardness measures the force of this attraction; steel is harder than lead, lead is harder than sugar, sugar is harder than soap. When the attraction between the particles of a substance is so weak that it cannot hold its shape, then we have a liquid, and we have any degree of liquidity between such half liquids as tar and such a perfect liquid as water. But all liquids take the form of some solid vessel which contains them. Left to themselves, they spread about and have no definite shape of their own. Heat is the direct opposite of the attractive force. If we wish to overcome the attraction between the particles of lead we put the metal in a ladle over the fire and it soon becomes a liquid. Heat has destroyed the force of attraction between the particles of lead. So with a liquid; if we abstract the heat, and allow the force of attraction to act, it soon becomes a solid, as with water. We have only to extract a certain amount of heat from water, and it at once becomes the solid ice, having all the properties of other solids. But we shall say more of heat at another time, as it is one of the most interesting subjects of any that we have to deal with.

But it is safe to say that the condition of Matter, whether solid or liquid, depends, as a general thing, upon heat, there being but few liquids that have not been reduced to the solid state by abstracting the heat, or what is the same thing, by exposing them to an intense amount of cold; and there are not many solids that, by the application of sufficient heat, have not been brought into the liquid state. What we wish now to take up is, the mechanical properties of liquids. As in solids, there is a wonderful difference in the density or weight, so there is an equal difference in liquids. The heaviest liquid, of which we have any knowledge, is quicksilver or mercury. This is fourteen times heavier than water. On the other hand we have liquids much lighter than water; you know that most oils will float upon the surface of water, because they are lighter, and there are liquids still lighter than any oil. You will recollect that in comparing the weight something was said about Specific Gravity. The Specific Gravity of a solid is its weight as compared to an equal bulk of water. So with the specific gravity of liquids. Water is taken as the standard of comparison, and when we say that the specific gravity of mercury is fourteen, we mean that a given bulk of it, for instance a tumblerful of it, would weigh fourteen times as much as the same tumblerful full of water. Not only are the liquids heavier than water, compared in this way, but also those that are lighter than water, using the minus sign. The specific gravity of ether is stated as .713. Perhaps you would like to know how the specific gravity of liquids is taken. There are two ways. One is to have a bottle that holds up to a mark on the neck, just a thousand grains in weight of water. If this bottle be filled up to the mark with quicksilver instead of water, and weighed, the bottle being balanced of course, the weight will be found to be fourteen thousand grains. So if we fill it to the mark with ether and weigh it, the weight will be about .713 grains instead of the thousand; so we say that the

Fig. 1.—A HYDROMETER.

specific gravity is .713. This, however, is a slow method of taking the specific gravity. A little instrument called the Hydrometer is used for this purpose, that long word meaning water measurer. The common shape of the hydrometer is shown in figure 1. This you see is a glass bulb, to the upper part of which is attached a stem on which figures are marked. Below it is weighted with shot in order to make it float upright in the liquid. When this is placed in pure water, the point to which

Fig. 2.—THE "POCKETS."

the instrument sinks is marked upon the stem. If this be placed in a liquid that is heavier than water, it will not sink so deep, and if it be placed in a liquid lighter than water, it will sink deeper. By the use of this instrument, we may easily learn the specific gravity of any liquid in which it may be placed. In practice there are two kinds, one for liquids lighter than water, and one for liquids heavier than water, as it would require too long a stem to have one instrument answer for both. These hydrometers are used in testing various spirits, acids, and such liquids the strength and value of which depend upon their specific gravity.

For example, Sulphuric Acid, or as it is more generally called, Oil of Vitriol, is largely used in a great number of manufactures—indeed so important is it in the various arts, that a distinguished man once said that the rank of a nation as to its arts and manufactures could be told by the amount of Oil of Vitriol it used in a year. When this is of proper strength, it is almost twice as heavy as water—its proper specific gravity being 1.845. If the bottle before mentioned as holding 1,000 grains of water, was filled with Sulphuric Acid, it would weigh 1,845 grains. The maker of the acid might add a fourth of its bulk of water, without the knowledge of the purchaser. But the purchaser can at a glance tell whether his acid is of the proper strength, by plunging the Hydrometer into a portion of it. So the Hydrometer is not merely a scientific toy, but comes into use in business life. ... But we can not just now say more about liquids as there is

## AN INTERESTING WHAT IS IT?

to be disposed of. My young friend, Edwin K., sends something which was found on the shore of Long Island

Fig. 3.—THE PERIWINKLE SHELL.

Sound. How his "something" looks is shown of the real size, as to width, in figure 2, but was, when found, about eight inches long. It consisted of many oval pockets, each attached by one of its broad sides to a sort of cord that held the whole together. These pockets were of a material much like parchment, or dried bladder in appearance, and like those substances, exceedingly tough. What may he called the front edge of these pockets, that is, the edge opposite that by which they are attached to the cord, is slightly wavy or "ruffled," and there is a small hole at this part. When one finds a thing that seems strange to him he should first

## PUT QUESTIONS TO IT,

before putting questions to us. Had Edwin, by shaking, asked if there were anything inside of these pockets, the rattling sound would have said "yes," just as plainly as we can. Then the next question would be—"What is inside of these?" only you would have to ask it with the point of a sharp knife—a little cut, a small opening, and out drop several little things, which rattle down upon the paper you have placed to catch them. These things that were in the pockets, what are they—they do not look like grains of coarse sand, but to make the matter clear you take a magnifier and lo! the story is told—

## THE GRAINS ARE LITTLE SHELLS!

and you know at once that this string of pockets or bags is somehow concerned with the early growth of a creature

that has a shell. Those of you, who live near the sea shore, must have often seen a shell like that in fig. 3.—only twice as long and wide, and even larger. This shell is shown empty, but it, of course, at some time contained an animal. On our shores this is called

## THE PERIWINKLE, OR WHEEK,

but is unlike the creatures known in England by those names. The material, sent by my young friend, is the spawn cases of this animal. I suppose that when this spawn is first laid by the animal, there are eggs in the pockets, but I never came across any in which the eggs had not been hatched, and the tiny Periwinkle had each a minute shell, like the large one in shape. Some persons eat the Periwinkle, placing them in water and boiling them, when the animal may be easily removed from its shell. Seeing others eat them, I once tasted a Periwinkle—that taste has answered for half a century, and I don't think I shall ever repeat it. The shells are used by boat-builders. You notice what a long spout, so to speak, it has; the boat-builders use them to run tar into cracks when they are "caulking" the seams of their boats; the body of the shell being filled with tar, it can be poured out through the long, narrow spout, in a very small stream. The scientific name of our Periwinkle is *Pyrula canaliculata*. *Pyrula* is from *Pyrus*, the Latin word for "Pear," and *canaliculata* is from the Latin word for a "channel," and means, having a small channel. If the scientific names of animals and plants look hard and unmeaning to you at first, they will seem different when you learn from what they are derived. A look at the engraving shows that—"The pear-shaped shell that has a little channel," describes it very clearly; *Pyrula canaliculata*, is only a shorter way of saying it.

## Our Puzzle-Box.

## CONCEALED FABRICS.

1. Jennie is forever bringing Hamburg edging home with her.
2. The plant was recommended to me by a farmer in Ohio.
3. She had read the poems of Walter Scott, only.
4. Tom said he had never read a line, never wanted to, and never meant to.
5. That is a pretty old fossil, Kate.
6. Is a tin trumpet a musical instrument?
7. We need not fear, they will not harm us, Lincoln.
8. Is the composer German or French?
9. As soon as I spied the rascal I concealed the money.

## NUMERICAL ENIGMA.

I am composed of 7 letters:

- My 7, 6, 5, 1, is a measure.
  - My 3, 2, 1, is the whole of anything.
  - My 7, 2, 3, 4, is unorganized earthly matter.
  - My 7, 5, 6, 4, is a weapon.
  - My 6, 2, 3, 4, is a metallic oxide.
- My whole may sometimes be seen in a drug-store, sometimes on the dinner table, and sometimes in the garden.

PERRY McI.

## CROSS-WORD.

My first is in hobble but not in limp,  
My next is in edging but not in gimp,  
My third is in hatchet but not in ax,  
My fourth is in honey but not in wax,  
My fifth is in letter but not in bill,  
My sixth is in valley but not in hill,  
My seventh is in river but not in lake,  
My eighth is in fritter but not in cake,  
My ninth is in pleasures but not in joys,  
My tenth is in bustle but not in noise:  
Now take my advice and be happy and gay,  
No matter what any old croaker may say.

## DEFINITION PUZZLES.

(Letters with which to form the word defined may be found scattered in each sentence.—Example. That by which anything is regulated. Word, rule.)

1. The little wheel of a spur.
2. Pertaining to life, very important.
3. Practice, custom.
4. A sort of scuffle.
5. Second growth of grass.
6. Very poisonous, malignant.
7. A place of worship.
8. A piece of mechanism.

## SQUARE WORD.

1. A friend.
2. Fat.
3. An asteroid.
4. To impede.
5. Cuts down.

## LITTLE FOLKS.

## CHARADE.

Hark! the morning bell is ringing  
From the steeple loud and clear,  
And the pious crowd is wending,  
Reverent souls, my first to hear.

On my next the grass is growing,  
Maybe 'tis a city lot,  
Upon the globe in every land,  
I'm sure to find my space and plot.  
The hideous whole, how shall I name it!  
Crud, bloody, fearful strife:  
I dare not tell the countless numbers  
That through me have lost their life.

AUNT SUE.

## WORD-MAKING.

(To one of the words in a list, add the letter at the end, and with it transpose the word into another.)

1. List: make, house, slow, phial, them, many; letter, C.
2. List: toe, hold, martyr, coward, lyre, he; letter, B.
3. List: hungry, greed, hoots, eye, mustard, cow; letter, L.
4. List: dreamer, broom, servant, gold, zone; letter, E.

## DOUBLE ACROSTIC.

- The initials form a river, and the finals an animal.  
 1. To rebuke. 5. An exclamation.  
 2. Real. 6. A city.  
 3. An animal. 7. A metal.  
 4. To strike. 8. To draw. NIP.

## The Ant and the Fly.

While passing along the roadside to-day I saw a small object moving over the flagging stones of the sidewalk.

Fig. 2. SKELETON OF MAN.

Sometimes the stems would make a net-work through which the great load would not pass, and after trying faithfully to break through, the ant would turn to one side and

At a second glance I saw it was a red ant, and that it was half dragging and half carrying a large fly, which appeared to be dead. That so small an animal could carry so large a load—the fly being two or three times as large as the ant—was interesting, so I stopped to see it done. Thinking what might be hard for the ant to do on the smooth stone, would be given up when greater obstructions were put in the way of its progress I turned the ant, with its load, towards the grass upon the border. It was hard work now, but the ant did not give up by any means, it tugged and pulled the fly over the grass stubble and grass stems that lay across its pathway.

Fig. 4.—A FLYING FOX.

go around the obstruction. In a number of instances, while I stood and watched, the ant would leave the fly when in a tight place and go in search for an easier pas-

sage. Once after looking for some time as if in dismay, the ant found a way out, and turning back towards the prize it raised itself on its hind legs and looked around as if to make sure, and then drawing its fore-feet across its head went vigorously at work. This last action may remind you of boys, and men as well, who, when they have some great task to perform, some heavy load to lift, will straighten themselves up to full length and moisten the palms of the hands with the saliva from the mouth. After I had followed the ant with its load for a considerable distance I put myself in its way, and made it go again to the sidewalk where at first, to its joy, it found much better travelling. But wishing to see what might be the ant's regard for its load I caught it and took away the fly. This made the ant much excited, and if the same motions should be made by a boy upon taking anything from him, we would all say that he was mad. The ant soon began to run in gradually widening circles, and very rapidly. The fly was again placed upon the paving stones about a foot from the "run" of the ant, and was in a few seconds in the hands of its captor. I then took the fly from the ant, simply separating them by an

ordinary envelope, edge down, when the ant tried its best to crawl under at the point nearest to the fly, but soon saw the folly of this and went around at the end. Just at this time a gust of wind came which lifted the fly up and carried it some feet away. The ant was again in anger, and began its circular motions as before. If my time had not been worth more than that of the ant's, I might have been able to state the results of this search; but as it was I brought the fly back to within a foot of the ant and he was soon happy again. As a parting torment I took the fly again, not raising it into the air, but pulling it rapidly along on the paving stones, when the ant followed in the trail and finally, greatly to its satisfaction, ran off with its booty. U. H.

## Something About Bats.

Bats are queer animals. One seldom tires of looking at them—either as they are flying in the air at sundown, or after they have folded their wings for a rest during the day. The early naturalists, that is those who studied natural objects many years ago, were puzzled by the bats; they could fly and therefore they called them birds and put them in the same order as the great Ostrich—which by the way does not fly. Bats have teeth—as many of the boys and girls may perhaps know by experience—and have a fine soft coat of fur; in these things they are like rats and mice. Why is it that a bat can fly through the air, and coming through the open window can flit around the room, while the little mouse is doomed to run upon the ground to be shut away from the bread and cheese of which he is so fond, if he cannot climb to it? The first figure will help us to answer this question. The first thing that one will notice in a bat are its peculiar wings. They are not like a bird's wings, but made up of a thin skin, stretched across from some bones which are made specially long for the purpose. It may be that some of you think the wings are like the top of an umbrella or a portion of one, and the comparison will not be far out of the way. In figure 1 we have the skeleton, or the bones of one of the larger bats, the flesh and all other portions having been removed. Figure 2 shows the skeleton of a man, of course greatly reduced in size. It will be seen at a glance that our own bones and those of a bat are a good deal alike as to number, position, shape, etc. That which just now interests us most are the bones of the hands. In man they are quite short, while in the bat they are very long. The middle finger, for example, being longer than the head and body of the bat. If we had our fingers as long in proportion as those of the bat they would be very much in the way; but if we had those fingers and a tough skin stretched between, then we should have wings like those of the bats; and perhaps we might use them for flying, and have great times in the air.

One of the most common bats is the Long-Eared one given in figure 3. But what is the use of having such big ears? you may ask. There is a common expression: "As blind as a bat." Now, bats are not blind, but their

eyes are very small and appear to be of a poor quality; this is especially true with the Long-Eared Bat. To make good for this lack of sharp eyes, the ears are of larger size, and in a measure take the place of the eyes—just as a blind person will make his ears do much of the work that his eyes would do if he could use them. The sense of smell of the bats is also exceedingly acute, the nose being of large size and grotesque form as if it had been turned inside out. These curiously formed noses

Fig. 3.—THE LONG-EARED BAT.

belong to those hats that pass much of their time in dark caves where there is little or no light. The delicate sense of smell also acts as a substitute for eyes in places where eyes would be of no use. Figure 4 shows one of the Flying Foxes, so-called on account of the red, fox-like color of the fur and foxy head. They are the largest of the bat tribe, some of them measuring five feet across the open wings. Although so large, unless roughly handled, they are not at all dangerous. The Vampire Bat, Fig. 5, is not so large by half as the Flying Fox, but has some very unpleasant stories told about it; it is accused of sucking the blood from sleeping persons. Many tales have been told of this South American bat; which is said to come silently by night and, poisoning itself upon the naked feet of its sleeping prey, fan the victim with its extended wings, which, producing a cool atmosphere in those hot climates, aid in soothing the sleeper into a still deeper repose. The bat then begins its work by making a tiny wound with its sharp teeth, and with its lips sucks the blood from its sleeping victim until he perishes from loss of blood. This is now considered but a traveller's tale, the real facts in the case being that the Vampire does bite animals and man, but the wound is usually very slight and never fatal.

The bats in the north, and those that most of the young readers of the *American Agriculturist* have met or are likely to meet, are small and harmless. If there is

Fig. 5.—VAMPIRE BATS.

any lesson of more than unusual importance to be drawn by a study of bats, it is the peculiar development of the hands, or paws, by means of which a group of animals, otherwise closely related to creeping and walking things, can rise in the air, and propel themselves through it with the ease of birds, though with irregular motions more resembling those of moths and butterflies.

### The Steers at the Fair.

The first fair that I ever went to was a Town Fair held in a grove near where I lived. It was so far away that we had to harness the horses and drive over, all hands going in a large wagon. I remember we hitched the horses on the road side some distance from the gate to the fair-grounds, and gave them some hay to eat while we went to see the sights on the other side of the high fence. The next fair that I attended was held at the same place just about a year after the first one, and the

was one yoke of steers that were, in my eyes at least, particularly fine. From the day they were born—both on the same day, and cared for by the same mother—they were my steers; not because I had bought and paid for them, but—you know how it is—in name, which amounts to much the same thing. That they looked alike might be expected, being so closely related—twins are often hard to tell apart, especially when they are small. But I knew Fred apart from Frank early in their calf life, and could have told the one from the other in the darkest night. I watched over these calves, combed them, fed

know walk with a cane. The fall after they were a year old, Frank and Fred were as well trained and as trusty as the oldest yoke of oxen on the farm—in fact, I thought more so. The “twin steers” were not only the pride of my young heart, but I observed the whole household took more than ordinary notice of them. It was getting “fair time,” and I knew it. I had had that fair in my mind all the summer through, and thought of it most when my steers behaved the best. They must go, I said, and none of the rest of the folks could raise any objections. I remember the day I took them on foot along

THE YOKE OF TWIN TRAINED STEERS AT THE DISTRICT FAIR.

third about a year after that. I might have kept on going to that Town Fair for many more years had it not happened that the Town Fair was changed to a District Fair and the Town Fair and its grounds were given up. How sad and lonesome the old trotting track looked, or rather the place where it was once so smooth and fine—all grown up to wheat, and afterwards to grass! The District Fair was a much larger one than the old Town Fair, as it took in more country. It was held in a much larger field, had more and better buildings; the track was larger and there were ever so many more people that attended it. It cost more to get in too; but it was worth more, for there was much more to be seen. I should probably have kept going to this District Fair every year until this day, and enjoyed it too, had not things so turned that I moved nearly a thousand miles away. But I intended to tell you about some *Steers at the Fair*. The steers were my steers, and the fair was that of the District that has been mentioned. “Our folk” had a great many steers; in fact, there was always one or more yoke to be broken every year, and as the boys were not very numerous in our family, I was “early and often” put to the whip—that is, given the old oxen and then the steers to drive. A boy has his fancies, and I had mine. There

them, and perhaps played with them when it would have been just as well as if I had been at work in the garden. They flourished under my care; were plump, smooth, gentle, hungry fellows all the summer long. How I did want to take them to the Fair in the fall; and I should have perhaps done it had it not been that I was taken sick and I was not able to go—and of course the calves could not go. That winter and the following spring the young steers were accustomed to the yoke and taught to draw the hand sled and the little cart. We used to call it “breaking” them; but they were so kind and took so readily to the yoke that the word “breaking” sounds harsh. The fact that they were so obedient may be because I was gentle with them. I had been cruel to other steers, and they had frequently served me an unkind turn—either of the head or the tail—and with this experience and the instruction of my elders I made up my mind to see what “sugar plums” would do with a yoke of steers, or in other words, if kind words and loving hands would not save the use of the whip. They will almost entirely; it is sometimes necessary to let a young steer feel, and with a little smarting of the skin, that there is a master whose will is to be his (the steer’s) guide, but in most cases I carried the whip much as some young men I

the road to be entered as “yearling steers” at the District Fair. But the scene when they were driven out on the following day to be viewed by the judges is much more vividly impressed on my mind. I shall not forget how well the young steers behaved themselves with all the people around—the small boys shouting, the older ones laughing, and the band playing. If I ever do forget that time I will go to my keep-sake drawer and bring out the red ribbon that was tied on Fred’s horn as the token that he and his mate had received the first prize. How the other young men with “yearlings” feel I do not know, but as for me I was more than paid on the spot for all the trouble—it was not trouble—that I had been to in bringing up the steers to their present state of usefulness. The artist has rendered me substantial aid in giving you a picture of my young team, and at the trying time when the eyes of the judges—and of the world, as I thought—were upon us. It all paid, boys. The kindness to the calves, the care of them as they grew up, the taking of them to the fair, all paid me, and it will pay any boy that can do likewise. Even a stupid (?) calf has noble traits of character that when brought out will bless the one that has the desire to help it to do it.

## Hardy Perennial Plants

Are increasing in popularity because they are

Hardy, their roots living through the winter—and

Perennial, appearing year after year in the same place.

They include the most beautiful kinds that bloom all through the season, from earliest spring to latest fall.

Autumn is in many cases the best season for setting out these plants.

Send for free descriptive Catalogue of the largest collection in the Country—including Hardy Climbers, Flowering Shrubs, Lilies, Phloxes, Ferns, etc. Also choice native plants.

WOOLSON & CO., Box 180, Passaic, N. J.

## IMPROVED BALDWIN'S AMERICAN FODDER CUTTER.

The Simplest and Best in the Market.

Has only three feed gears.

Cuts all kinds of Feed,

Hay, Straw, and Corn Stalks with ease and rapidity. Each machine cuts four lengths, and is self-teasing. Can be fed light or heavy as desired. Nine sizes for hand or power.

The Cut represents our Power Cutter, No. 13, with Patent Safety Fly Wheel, which insures the operator and machine from danger, should any foreign substance be fed into the machine when running.

It is the only practical safety-fly wheel in the market, as it is governed by pawls and ratchet, and not by friction.

Our Power Cutters are especially adapted for cutting all kinds of Green Forage for the new Ensilage process, have been thoroughly tested, and always victorious. Recommended by Dr. Bailey in his Book of Ensilage. Send for illustrated Circular, containing full description and testimonials.

**C. PIERPONT & CO., Manufacturers,**  
NEW HAVEN, CONN.

HAS NO SUPERIOR; ADMITS No Equal.

**Good Agents Wanted, both Male and Female, to whom Liberal Inducements are Offered. Agents can make from \$10 to \$100 per week.**

## THE ART OF CLEANSING FABRICS

is yet but imperfectly understood by thousands of good house-keepers. The numerous devices of friction rollers, pounders, squeezers, dashers, agitators steam wash-boilers, etc., have all failed in one or more of the three essential points, namely: The saving of labor, wear and tear of clothes, or in perfectly extracting the dirt and discoloration

## WHAT IS IT REMOVES THE DIRT?

You may ask washer-women and house-keepers, and your answer from nine out of ten will be, "Plenty of elbow-grease," or in other words, laborious rubbing upon the wash-board. And such is the case, for you first rub soap upon the cloth, and then you have to rub it in to make the dirt soluble; but does that remove it? No; to do that you must dip it in the water and rub repeatedly to force water through the fabric, again and again. That is what removes dirt after having been softened by the chemical action of the soap.

The way in which this could be most economically accomplished has been developed in the FAMILY WASHER AND BLEACHER, which embodies all the above points.

Mechanical devices take the entire time of a person during the whole wash and will not remove streaks from clothes. It is harder to operate them than to use the common wash-board. They are constantly getting out of order, and wear out in a short time. With all such devices, as well as the rubbing-board there is great friction and consequent unnecessary wear and tear of clothing. With the Washer and Bleacher there is no friction or wear of the fabric whatever; washing, baking, and housework are contemporaneous operations—the fire doing the washing and baking, while the housewife does her housework. As stated, water force is what removes dirt from the fibre of the cloth. A large body of water is required to hold in solution a comparatively small amount of dirt.

## THE PRINCIPLE OF THE WASHER AND BLEACHER

embodies all the essential points. First, we have the desired heat which expands the fabric and causes it to discharge the dirt. Second, we obtain a powerful suction beneath the clothes, which produces a rapid downward current or water force through and through them, thereby removing the dirt. Third, we use a large body of water, which holds the dirt in solution. Fourth, we use but a small quantity of soap. Fifth, the washing is done by water, and not by steam. This process cannot injure fabrics. It cleanses thoroughly, rinsing the clothes being all that is required to complete the operation.

## THE PHILOSOPHY OF THE WASHER AND BLEACHER IS THIS:

We have 5 lbs. of metal, which attains a much greater degree of heat than the water surrounding it, consequently the water underneath the Washer becomes hotter and more

expansive than in any other part of the boiler, and is thereby thrown to the surface through the tube; thus tending to produce a vacuum underneath the Washer at the bottom of the boiler, into which the water is rapidly drawn.

As it passes along the channels of the Washer, the curved and contracted throats of which prevent its flowing backward, it becomes hotter and hotter, consequently more expansive and more forcible until thrown to the surface, thus producing a powerful suction beneath the clothes through which the water must pass in a rapid downward current, thereby obtaining a water force which cannot be obtained by any other method known in cleansing fabrics. Thus, we get a combination. **FIRST, WE HAVE THE DESIRED HEAT. SECOND, PERFECT CHEMICAL ACTION OF THE SOAP. THIRD, FORCE OF WATER—ALL OF WHICH ARE REQUIRED TO THOROUGHLY CLEANSE AND PURIFY ANY FABRIC.**

## THE IMPROVED WASHER,

has a perfect fitting pipe, and is a combination of metals which does not become sticky or dirty. It comes out of the boiler as bright as new.

## THE CAPACITY OF THE WASHER AND BLEACHER.

There are two sizes: No. 1, the family size; No. 2, suitable for small hotels, restaurants, and barber-shops, boarding-houses, etc.

The Washer is composed of metal and cannot get out of order.

The discharge pipe is 13 inches high, and 1 1/4 in diameter. It throws water in a solid, unbroken stream, at the rate of 6 to 8 gallons per minute. It will work in any flat-bottom boiler. It takes only 3 or 4 ounces of soap in 10 or 12 gallons of water, and will wash bed or table linen, a boiler full in 10 to 15 minutes, wearing apparel in from 10 to 30 minutes. Use no chemicals, only good soap and soft water. If the water is hard, it may be softened by a small piece of borax, which is harmless.

FOR LACE CURTAINS this Washer is invaluable. It cleanses them as no other process can, and without the slightest danger of injury.

No. 2, or small hotel size, will work in a flat-bottom boiler holding 15 to 25 gallons, and wash of average pieces from 1,500 to 2,000 per day; or it may be used in any smaller boiler that has a flat bottom large enough for it to rest upon. For hospitals this Washer is pronounced by the medical faculty invaluable, being the most perfect disinfectant known; leaving the fabrics pure as when new. By bleachers and chemists it is said to be the most efficient method of removing dirt and vegetable matter from fabrics ever known.

## THE INDUCEMENTS WE OFFER.

We want a Local Agent in every town in the United States. We want first-class men as GENERAL AGENTS; men capable of managing one or more counties.

To such we give a duly executed Certificate of Agency.

We furnish descriptive circulars for distribution among families. Also large posters for advertising in public places. Printed directions for using are sent with each Washer.

The retail price of No. 1 WASHER, in New York, is \$3.50; No. 2 WASHER, \$5.00; No. 1, \$24.00 per dozen; No. 2, \$36.00 per dozen.

WE SEND SINGLE OR SAMPLE No. 1 WASHERS, PREPAID, TO YOUR NEAREST RAILWAY EXPRESS OFFICE, in any part of the United States east of the Mississippi and Missouri Rivers, also in Kansas, Nebraska, Arkansas, Louisiana, and Texas, for \$3.50.

## SPECIAL NOTICE.

As to the reliability of this Company, we refer you to the MERCANTILE NATIONAL BANK of this city, or to any Express Company in New York. Also to the Publishers of the following named well known leading journals, viz.: New York—American Agriculturist, Weekly Sun, Weekly Times, Weekly Tribune, Weekly Witness, Weekly World, Christian Advocate, Christian at Work; Boston—Youth's Companion, American Cultivator; Chicago—Inter-Ocean, Cincinnati Gazette, Andrews' Bazar, Springfield Farm & Fireside, St. Louis Journal of Agriculture, Detroit Free Press, all of whom have frequently editorially endorsed us as well as our Washer.

From the Rural New Yorker, May 8, 1880:—"Lately we had special reasons for thoroughly testing the character of the Robbins Washer and Bleacher. The test has been fully made up for upwards of a month in the family at the Rural Farm, and has demonstrated the great merits of this machine. On every occasion in which it was used, this Washer did everything that is claimed for it in an entirely satisfactory manner. We can, therefore, unhesitatingly recommend it to all our readers who may be in need of a first-rate Washer and Bleacher."

From the N. Y. Weekly Tribune, May 19, 1880:—"Washers Again.—We have several inquiries concerning the Robbins Washer and Bleacher. It does exactly what is claimed for it, and is cheap at ten times its cost."

In ordering, write plainly your name, post-office, county, and State. Also the name of the express office to which you wish the Washer forwarded.

## CASH MUST ACCOMPANY ALL ORDERS.

Remit by Post-office Order or Registered Letter. We insure the safe delivery of all Washers ordered as above. Money may also be sent by draft on New York.

Send for a sample and secure A BUSINESS THAT WILL PAY YOU WELL.

When you order or write, mention this paper. Address

**Bissell Manufacturing Co.**  
50 BARCLAY ST., NEW YORK, U. S. A.

Also our celebrated Kentucky Rifle for \$12, warranted or no sale. Send for Illustrated Catalogue and Price Lists to **James Bown & Son, Enterprise Gun Works, 136 & 138 Wood St., Pittsburgh, Pa.** ESTABLISHED, 1848.

## AGENTS WANTED FOR THE

**SUMMIT**  
Stove-Pipe Shelf and Utensil Stand, the most convenient article ever offered to housekeepers. Agents meet with greater success than ever. One agent made \$192 in 15 days, another \$38 in 2 days, another \$27 in 1 day. No Freight Charges. Address office nearest you. **SUMMIT MANUFACTURING CO.,** Philadelphia, Pa.; Cincinnati, O.; St. Louis, Mo.

**L. E. RANSOM, 34 MAIDEN LANE, N. Y. CITY.** Importer of Annatto and Dairy Coloring.

\$1.25 a Year.  
Specimen Copy, 10c.  
Trial Trip, 3 months, 25c.  
with chromo.

A LARGE 16-PAGE  
Illustrated Journal,  
Devoted to Floral and Household Topics.  
The newest Music with each No.

—Send for Premium List to—  
ADAMS & BISHOP,  
Box 2456, 46 Beekman St., N. Y.

Send 3c. for Specimen Copy of "Fret Sawyer's  
Monthly." ADAMS & BISHOP, 46 Beekman St., N. Y.

## Music Books for 1880--81.

**BLAKE'S DOLLAR** Instructor for the Reed Organ. Self-instruction and Teachers. \$1.00.

**BLAKE'S VIOLIN** and Piano Duets. New Collection. \$1.00.

**BAILEY'S SCHOOL** Songs and Music Reader. New Collection for Schools, etc. Academies, 50 cts.

Either of the above post free on receipt of marked price.

## A Three Cent Stamp,

will secure 17 pages of New Music, 10 pages of Musical News and Instruction, a full page Lithograph Portrait of some musical celebrity, and much valuable information. Send stamp to  
**WHITE, SMITH & CO., Boston, Mass.**

## Make the Children Happy!

**\$1.50 THE NURSERY. \$1.50**

NOW is the time to subscribe for this **BEST ILLUSTRATED MAGAZINE** for the young. Its success has been continuous and unexampled.

REMEMBER, that by subscribing now for the year 1881, **EXTRA NUMBERS** may be obtained.

Send 10 cents at once for a Sample Number and **PREMIUM LIST**.

## EXAMINE IT! SUBSCRIBE FOR IT!

Address **The Nursery Publishing Co.,**  
36 Bromfield St., Boston, Mass.

## Scribner's Lumber & Log-Book.

NEARLY A MILLION SOLD. Most complete book of its kind ever published. Gives measurement of all kinds of lumber, logs, and plank, by Doyle's Rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cordwood tables, interest, etc. Standard Book throughout United States and Canada.

Ask your bookseller for it, or one sent by me for 35 cents, post-paid

**G. W. FISHER,**

P. O. Box 238, Rochester, N. Y.

**3 AUTOGRAPH ALBUMS,** all different, for 25 cents.  
**64 PAGE AUTOGRAPH ALBUM,** illustrated with 32 PEN SKETCHES, Birds, Motives, FERNS, new 32 Japanese Designs (JAPANESE COVER) & 100 Album Quotations, ALL FOR 15c. 6 for 60 cents. J. F. INGALLS, Lynn, Mass.

## AGENTS WANTED to Sell the NEW BOOK, FARMING FOR PROFIT

**TELLS HOW TO**  
Cultivate all the Farm Crops in the Best Manner; Breed, Feed and Care for Stock; Grow Fruit; Manage Farm Business; Make Happy Homes; and  
**MAKE MONEY ON THE FARM.**  
Every Farmer should have a copy. 860 Pages. 140 Illustrations. Send for circulars to  
**J. C. McCURDY & CO., Philadelphia, Pa.**

## Agricultural Analyses.

**A. R. LEDOUX & CO.,**  
ANALYTICAL & CONSULTING CHEMISTS,  
LABORATORIES? 17 Cedar Street,  
AND OFFICE, } New York City.

CHEMICAL ANALYSES AND INVESTIGATIONS OF ALL KINDS.  
AGRICULTURAL CHEMISTRY A SPECIALTY.  
Analyses of Superphosphates, Chemicals, Feeding Stuffs, Soils, Manure, Waters, etc., etc.  
Special contracts made with Agricultural Societies, Farmers' Clubs, Granges, and Manufacturers.

## RECALIN PRESERVING POWDER.

Awards and Medals: Centennial; "Superiority," by the American Institute, N. Y.; as "The Best Preserving Salt" at the International Dairy Fair.

Tasteful. Preserves Butter, Eggs, Cider with fullest aroma as if fresh; invaluable for Pickles, Fruits, Vegetables, and on Salted Meats.  
50 cent box sent by mail on receipt of price.  
Address **C. AM ENDE, Hoboken, N. J.**

## New Books

## Great Interest and Real Merit.

**True Manliness.** From Thomas Hughes. Introduction by James Russell Lowell. 16mo. Cloth.....\$1.00

**Pushing Ahead.** By Rev. E. A. Rand.....1.25

Profusely Illustrated. With Valuable Appendices. 608 pages. 12mo. Half Roan. \$1.75.

For the Family and the Library.

## WORCESTER'S QUARTO DICTIONARY.

Fully Illustrated and Unabridged. 1854 pages. Library Sheep, Marbled Edges. \$10.00.

For sale by all Booksellers, or delivered free of expense, on receipt of price, by the Publishers,

**J. B. LIPPINCOTT & CO., Philadelphia.**

## ARCHITECT.

Specifications of all kinds of Buildings supplied at shortest notice. Address **S. B. REED.**

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from Page 420.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

**The German Edition.**—All the principal articles and engravings that appear in the *American Agriculturist* are reproduced in the German Edition. Besides these, there is a special department, edited by an eminent German cultivator. Our friends can do us a good service by calling the attention of their German neighbors and friends to the fact that they can have the paper in their own language, and those who employ Germans will find this Journal a most useful and acceptable present.

**Bound Copies** of volume 38, and of every previous volume back to Vol. XVI. (1857), neatly bound, with gilt backs, Index, etc., are supplied at \$2 each (or \$2.30 if to be sent by mail). See Publishers' Notes, 2d cover page.

**Clubs** can at any time be increased by remitting for each addition, the price paid by the original members; or a small club may be made a larger one at reduced rates, thus: One having sent 6 subscribers and \$7, may afterwards send 4 names more and \$3, making 10 subscribers for \$10.00; and so for the various other club rates.

**Terms to New South Wales, New Zealand, Australia, Africa, etc.**—To several inquirers. Under the latest revision of the Postal Union Regulations the price of the *American Agriculturist* (either English or German edition), including postage prepaid through, will be covered by 7 shillings sterling per annum. This applies to the above countries, and to all others embraced in the General Postal Union. The simplest mode of remittance is by Postal Money Orders, payable in London, to the order of Orange Judd Company. These can be readily cashed in N. Y. City at a slight discount, which the publishers will cheerfully pay. For Club rates, (postage included), see our second cover page, and reckon 22 cents to the shilling sterling.

**Hen Manure and Ashes.**—"F. H. A." can buy unleached wood ashes at 10 cents a bushel and hen-manure at 15 to 20 cents, and wants to know which he had better devote his energies to gathering.—No doubt the hen manure is the cheapest at the rates stated for most crops. Yet it would be quiet worth while to collect the ashes too, especially for application upon grass land. As for night-soil, it will be time enough to collect that when you have exhausted the locality of hen-manure and ashes. Read the brief article on "Manuring with Brains," in the August No., page 302.

**How to Preserve Eggs.**—"F. B.," Colorado. A common way is to pack eggs in barrels and fill up with water drawn off from freshly slaked lime, allowing some of the slaked lime to go with the water. Such eggs sell at a low price as "limed eggs." Any method for excluding the air will preserve eggs for some time, but they will not be fresh eggs.

**Hessian Fly Attacking Rye and Barley.**—"C. B.," Nemaha Co., Neb., inquires, whether the Hessian Fly attacks Rye and Barley. We have never observed the fly upon any grain but wheat, but Dr. Chapman is quoted by Harris, ("Insects Injurious to Vegetation") as saying in the *Encyclopædia Britannica*, that in 1797 they were found west of the Alleghany mountains, and that wheat, rye, barley, and even timothy grass were attacked by them.

**How to Kill Canada Thistles.**—"J. S.," Henry Co., O. Canada thistles are easily destroyed if one can have patience to keep them cut off as fast as they come to the surface. This may be done by putting some root crop like mangels on the ground, working in it the whole season through, and doing this two years in succession. Smothering with swamp grass or straw will destroy them.

**Catching Gophers.**—"H. K.," Council Bluffs, Iowa, writes: "I noticed in the *American Agriculturist* that you ask for a better way of destroying gophers, than that of poisoning them. I am very successful in catching them in steel traps, the only trouble is that few people know how to set them properly. When I want to catch one I go to one of the freshest hills I can see, and dig into it until I come to the hole, then I dig out the earth a little until I can see where the hole forks, and carefully remove a little earth from the bottom, so as to allow of the traps being placed level with the bottom of the run, then fill up the unevenness around the trap with some fine earth. I build the mouth of the hole up with clods, and then chances to one that you will have him by next morning, and some times in an hour or less. I think this is the best way, as it costs nothing but a trap and the trouble of setting it. Use no bait."

**Hints and Helps for Everybody.**—The giving of a large number of labor-saving—and consequently money-saving—appliances, has always been a conspicuous feature of the *American Agriculturist*. In no former years has it given so many as in that now closing. This we attribute to a word of encouragement given early in the year, which we would now in substance repeat. If in the work of the farm, the garden, or in that of the house, you have found any contrivance or device especially useful, no matter how simple it may seem, if it is useful to you it may be so to thousands of others. Such things are usually best described by a drawing. Whether you can draw or not, make a sketch, no matter how rude, if the measurements are put upon the parts, we can make an engraving from it. Every reader can at some time help many others by sending us sketches of useful devices for the farm, garden, etc.

**To Grow Weeds.**—Thoroughly prepare the soil by plowing, harrowing, and manuring—all this costs money—in fact prepare the soil as if a crop of roots or grain was expected, then sow or plant the seed of some agricultural plant, carrots are good, but turnips will do, and leave the soil to take care of itself. At the end of the season, if there is not a full crop of weeds with seed enough to stock the whole neighborhood it is not your fault, for as a grower of weeds you have done your part. The truth of this statement is founded on an extensive series of experiments, in this and other countries, that settled this point long ago.

**Warts.**—"J. S.," Baltimore, Md. Warts consist of an enlargement of the papillae of the skin with a thickening of the epidermis or scarf skin. They appear more frequently on young animals, and affect various parts of the body—the under side of the abdomen, the mammary gland, the eye-lids and lips being the favorite seat of the affection. They often disappear without treatment, but in some cases are quite persistent. When of the pedunculated form (*i. e.* small at the base) they may be readily removed by a ligature, or by twisting, or they may be snipped off with scissors. If the base is broad, repeated applications of strong acetic acid will remove them by a gradual destruction of the epidermis covering the tumor. We have seen cases in which they appeared in a short time, in large numbers, in young animals, on the underside of the body and legs, and as quickly disappeared without the application of any remedy.

**Wild Carrot—a Weed.**—"J. S. R.," Rainshoro, Ohio, sends very complete specimens of a plant that is becoming very common in his locality, and wishes to know whether it is a native of this country, etc. The plant is the Wild Carrot (*Daucus Carota*), and is just our cultivated carrot which has reverted to the wild state. This, and its relative of the same family, the Parsnip, are among our most common weeds. In the older States, both are very abundant, but the Carrot is the most so, and often whitens whole fields when in bloom. Being a biennial, it is not so difficult to subdue as some perennial weeds, as it does not spread by the root. It produces seeds in the greatest abundance, and in this manner spreads very rapidly. Each of the little one-seeded fruits, commonly taken for seeds, is provided with a great number of hooks, by means of which it attaches itself to the covering of both men and animals, and is thus readily carried from place to place. It begins to bloom in midsummer, and continues through the season. Its umbels of white flowers, produced in succession, are at first flat, and usually have in the center of the cluster one single dark purple or maroon colored flower. We have occasionally seen plants the flower-clusters of which were purplish throughout. After the bloom is over, the clusters, as the fruits grow and mature, become concave, and at length become of a shape that suggest the children's name of "birds'-nests." If the plant is not allowed to ripen its seeds, it will soon disappear, hence it should be mown while in flower, and if the roots push up other flower-bearing stems, a second cutting must be made. Remember, it will do little good to cut off the flowers

from the plants in the fields, and leave ample seed-beds on each side of the roads. If neighbors will co-operate, the Wild Carrot can soon be disposed of. Many may have been troubled by having their cultivated carrots come into flower the first year; this is said to be due to the fact that the seed was raised where the wild carrot was abundant, and the seed-bearing plants had been crossed with the wild. Of the truth of this statement we are not quite sure, but find the belief very common.

**Some Things We Can Not Do.**—We do not propose to enumerate all the things that we can not do, but recent letters suggest two. We can not find situations in the city for young men. Aside from the fact that 99 in every 100 young men who wish to come to New York had better stay away from it, we have no unfilled place in our own business, and know nothing about the business of others. We can not purchase, or tell parties where to purchase farms. If we wished a farm or a place of any kind, we should at once put our wants in the form of an advertisement, feeling very sure that our next want would be, help to open the many replies that would come to us in answer to the published desire.

**The Ailanthus in Nebraska.**—"A. H. R.," Willowdale, Neb., writes that he intended to try the Ailanthus, but hesitates, as he has seen a statement in an agricultural journal that the tree is not hardy in "the West," and asks our opinion. We believe that the Ailanthus has not proved hardy in some parts of Northern Illinois, and there may be places in Nebraska where it would not endure the winters. Upon the northern limits of any tree local influences make a great difference, and parallels of latitude do not serve as guides. The Ailanthus flourishes in the climate of Boston, and we think that the injury reported from Illinois is not altogether due to the severity of the climate. Our correspondent, unless he meets with local experience, can easily try the experiment, and if, as proposed, he sets the trees in poor soil, it will be favorable to success.

**Exorbitant Charges for Repairs.**—"H. C.," a farmer in Orange Co., N. Y., writes us a long and indignant letter upon what he considers exorbitant charges for repairs upon farm machinery. He complains that he pays the price asked for a new machine, but when he needs a small casting he has to pay far beyond what he considers its value, and cites other instances of extortions. We do not see that it would aid our friend were we to give the names of the makers thus accused. The makers of some mowing machines, at least, give a list of every part likely to be needed in repairing, and one can know at the outset the cost of whatever "extras" he may need. In selecting an important machine like a mower, the farmer should take into account two things that are often overlooked; 1st. Are the parts needed for repairs kept in stock; and, 2d, the relative nearness of the factory or agency where they may be had.

**Pickles in Glass Jars.**—We have many letters asking how to put up pickles so that they will look like those sold in glass jars at the stores. These pickles look beautifully, but we can not advise our readers to try to imitate them in all respects. The fine appearance of these pickles is due to two things, the "greening" and to the use of colorless vinegar. The very green pickles are made so by soaking them in a solution of alum, and verdigris. The use of a small quantity of alum, an ounce to every five gallons of water, to harden the pickles, is not objectionable. After the salted cucumbers have been thoroughly freshened by soaking in blood warm water, and changing it every day, until the cucumbers are fresh enough, they are put into the alum water and kept at blood-heat for a day or until sufficiently hard. If they are not green enough, be sure not to use verdigris. The vinegar used is called "White Wine Vinegar," but it is really made from whiskey and water. Its only merit is, that it is colorless, it is a pure acid, and without the fine fragrance and flavor that belong to cider, or even to real wine vinegar. For home use, cider vinegar is vastly preferable; but the pickle makers, for the sake of looks, use the other.

**A New Wheat.**—G. A. Hisey, of Seneca Co., Ohio, sends half a dozen beautiful heads of an amber-colored wheat which he has raised for two years, and which originated in this wise: "Three years ago," he writes, "a package of wheat was received from the Department of Agriculture, sown, and proved worthless. There were three heads so different and apparently superior, that they were saved and sown. This wheat proves very productive, and the flour is of an extra good quality. It is as early as the Fultz; the straw is stiff and stands up well."—The heads are large, bearded, with eleven spikelets on each side, and frequently three kernels in a spikelet. The grain is amber-colored, above medium size in the samples we have—not plump, but fairly full. It seems to be a variety well worth growing, and should be tried both as winter and spring wheat. If it con-

tinues to hold its own with other first class wheats, and is superior in some respects, it should be named and introduced—otherwise not; we have many tolerably good varieties now, and certainly do not want any more.

**Pollen Grains Carried by Wind.**—Dr. Geo. Engelmann shows the lightness and floating power of the fertilizing dust (pollen) of the pine, in a statement that pine pollen has been found in the streets of St. Louis during a northern storm, from the pine forests on the Red River 400 miles away. Pine trees produce a wonderful abundance of pollen, as any one who has passed through a pine grove, when the trees were in flower, must have observed. The least disturbance given to a branch brings the yellowish dust down in copious showers. The wind has often carried great quantities of pollen to a distance, and deposited in such profusion as to give the idea that there has been a shower of sulphur. We have on several occasions had a portion of the "brimstone" sent us (and the color is not very unlike that of sulphur) from various parts of the country; a glance at the powder through a strong microscope at once shows it to be the pollen grains of pine trees. If those who are disposed to look upon the shower as a warning one of brimstone, would gather a little of the powder and burn it, their fears might be allayed by proving it not to be sulphur.

**To Measure Timber.**—It is a slow process to obtain the number of feet of lumber in square timber by the actual multiplying together of the three dimensions. All this work is avoided by the use of a Lumber and Log Book by J. M. Scribner, which is made up almost entirely of tables so arranged that the measuring of lumber becomes more a pastime than a tiresome mathematical work. For example, you have a scantling  $2\frac{1}{2}$  by 8 inches in area of cross-section, and 19 feet in length. In an instant it is seen that there are  $31\frac{1}{2}$  feet of lumber in the scantling. If the timber is round the difficulty of accurately measuring it is made equally easy by this little pocket Log Book. For example, a log with an average diameter of 19 inches, and 45 feet long, is seen at a glance to contain  $51\frac{1}{2}$  cubic feet. This is one of the most useful little books that we have had occasion to use, and at the small cost of 35 cents, should be in the hands of all who have lumber of any kind to measure.

**Soap Boilers' Waste.**—"P. G. E.," Balt. Co., Md., writes: "If not too much trouble would you please tell me the value of soap makers' waste; it appears to be principally lime with a large per cent of animal matter, and lumps of soap (I suppose the settlements of the kettles). The soap makers use a large quantity of soda, and it ought to be a strong manure."—Soap boilers waste is a very indefinite term. It is largely common salt (used to precipitate the soap out of the solution in which the saponification has taken place), with some caustic soda. It is worth something, in all probability enough to pay for carting three miles and perhaps enough to warrant paying a few dollars a month for the product of the establishment. The animal matter in the waste does not amount to a great deal. The salt is the main, in fact, almost the only thing of much consequence. Sometimes salt does a great deal of good. Sometimes little or none. The commercial value of such stuff would be as indefinite as its agricultural value.

**Central Park.**—Much fault has been found with the details of management at Central Park, for several years past. A step has been taken in the right direction in the appointment as Superintending Gardener, of William L. Fischer, who held a similar position in the years when the park was at its best. The public will be the gainer by this restoration of Mr. F. to the position he long and ably filled as Superintendent of the garden.

**Drain Tiles.**—If properly done, draining is a permanent improvement upon the farm, but it is a paying investment only in such cases. It is not enough to lay the drains in the right direction, with the proper descent, with the proper outlets and well protected. The tiles themselves must every one be perfect, in order that the work may last for generations and give no trouble in the future. If a tile is soft, being half baked, is cracked, or in any way imperfect, throw it aside. Such a tile is like a weak link in a chain, rendering the good ones useless, and when once laid in the drain is hard to find, and very difficult to mend. Use only the best of tiles.

**To Break up a Sitting Hen.**—"M. C. D.," Falls Village, Conn., writes: "I notice J. S. of Baltimore, Md., tells how to break up a brooding hen; I think my way better. I keep 100 hens, and have a coop four feet square and two feet high. When I gather eggs at night, I put all sitting hens in the coop, and keep them there two days, feed and water well, and let them out, and find that they soon commence to lay again. I have had the care of fowls for 15 years with good success."

**The Army Worm.**—Prof. C. V. Riley read a paper on the Army Worm at the recent meeting of the Association for the Advancement of Science, in which he said: "The fact is demonstrated that the insect hibernates in the larva as well as in the imago state; that there are several annual generations in southern latitudes, and more than one in New England; that the destructive generation is not always first, as has been supposed; that turning over a field in winter, though productive of much good is not an infallible preventive; that a wet season is not necessary to its excessive multiplication and injurious manifestations, as Fitch maintained; and finally, the true reason why the insect is more injurious in or near low, rank, wet or swampy grass lands is doubtless because such lands are most often neglected and not pastured, and because the moth finds an abundance of nourishment in such places."

**Feeding Young Animals.**—There is danger of over-feeding young animals and especially with rich food. Young colts, for example, are frequently injured by having too much meal, shorts, etc., fed to them. It is better to give them coarser food, even though they may not look so fat and plump, as their digestive apparatus will not thereby be overtaxed and injured.

**A Farmers' Club.**—The town of Bedford, Westchester Co., N. Y., has a Farmers' Club which meets the last Friday of every month at 2 P.M., at the house of one of its members. This Club, which was established in 1852, lays out a plan for the year's work by selecting a list of subjects for discussion. This list is printed on a portion of the postal card which the Secretary of the Club uses in notifying the members of the coming meeting, etc. The subject for the monthly discussions for 1880-1881 are as follows: "April, What crops shall we grow?—May, Weeds, and how to destroy them.—June,

Fruit and flower show.—July, Farmers' Recreations.—August, The possibilities of 100 acres of average land in the town of Bedford.—September, Renewal of pasture.—October, Keeping Fruits for family use.—November, Warming and ventilating our houses.—December, Sleds for farm and road use.—January, Farm dogs.—February, Culture and profits of small fruits in this town.—March, Annual meeting, election, miscellaneous business, etc." We commend this method of the enterprising Bedford Farmers' Club to the thoughtful consideration of other Farmers' societies, associations, etc.

**Feeding Bran.**—In a ton of wheat bran there are 54½ pounds of Phosphoric Acid, and in a like amount of rye bran 68½ pounds. Rye bran is also richer in Potash, hence for food and the resulting manure, rye bran is to be preferred to wheat. It is beyond question that in feeding bran a good part of the profit is made in the superior quality of the manure, and if the direct results of the feeding of bran pay, the increased value in the manure is all clear gain. Bran is an excellent food for the production of milk, and also for young stock.

**Corn Smut.**—"P. H. F." The trouble with your corn is caused by a parasitic fungus *Ustilago Maydis*, commonly called "Corn Smut." This fungus attacks the ear and sometimes the tassel, and even the joints of the stalks. It changes the grains into large swollen masses of a fine, dark-brown, dusty powder. The only remedy is to cut off the diseased portions and burn them; if left without being destroyed the fine spores will propagate the trouble in succeeding years. Cattle should not be allowed to cat-smutted corn in any considerable quantities, as it is found to be injurious to them.

**A Principle in Feeding.**—All food beyond such amount that is properly digested and assimilated by the animal is a source of loss to the owner, and that in two ways: First, the food is lost; and second, the animal is not kept in the best condition for getting the most out of its feed—its stomach is overloaded and its digestive apparatus more or less disarranged. Just inside the limits of assimilation is the point to have in view in feeding; in this way the animal will have a good appetite, and other things being equal, is sure to give the best returns for food consumed. There is a golden mean in feeding farm stock, which the farmer should find.

**American Tea.**—Some time ago Mr. Jackson, a Scotchman by birth, and for fifteen years a grower of tea in India, came to this country and was soon impressed with the importance of the American tea question, then under investigation by the Department of Agriculture. Mr. Jackson went through several of the Southern States, examining the soil, climate, etc., and finally bought a plantation in Liberty Co., Georgia, upon which a number of tea plants had been set out some twenty-five or thirty years ago. The place was cleared up and new tea plants set out, so that at the present time there are 165,000 tea plants under Mr. Jackson's care upon his plantation. Congress has made an appropriation of the small sum of \$5,000 to further the culture of tea, and the Commissioner of Agriculture, with the assistance of Mr. Jackson and others, intend to push forward the experiments, and finally hope, and at no distant day, to demonstrate that not only good tea can be grown in many parts of the United States, but that it can be produced with a good profit.

**Action of Lime on the Soil.**—Lime, as it comes from the kiln, is known as caustic or quick lime—the heat having expelled the carbonic acid gas of the carbonate of lime or lime stone. Upon exposure to the air and moisture this caustic lime absorbs water and carbonic acid gas, and again returns to the carbonate. During this reversion it decomposes vegetable matter and sets the elements of plant food free. It is in this power to prepare food for the growing crop from the vegetable matter in the soil that the chief value of lime resides. The greater the per cent of the lime that is in the caustic state, the more valuable it is for this work. The quicker the lime can be applied after burning the better.

**Feeding for Manure.**—"W. L." Duchess Co., N. Y. There is no question that profit can be made by buying steers of the right kind in the New York or Albany markets, taking them to your farm and feeding them until the spring and then selling them. There will be profit on the meat made and on the manure left. But profit cannot be made unless the right kind of steers are purchased. Thrifty, healthy, but unripe animals are what are needed, of a kind that will fatten easily. Thin grade Colorado steers, fresh from grass, sell in the New York market at 7¢@8¢. per lb., and when fat these bring 9¢. per lb. So that there is not only the gain in flesh, but the gain in price on the whole weight as the return for feeding. There is doubtless a good opening in this direction for an increased business, which is done to some extent already, even in the vicinity of New York.

**Young Men in Horticulture.**—From time to time we have had letters from young men with tastes for horticultural pursuits, asking where they could go for instruction in the propagation of plants and other matters relating to plant culture. Generally we have not been able to aid such applicants, but at present we know of an opening where the proper applicant can receive such instruction. Address "Horticulturist," care of the Editor of the *American Agriculturist*.

**Moore's Early Grape.**—A basket of this recently introduced grape was received September 6th, from the originator, Mr. John B. Moore, of Concord, Mass. The condition of the fruit demonstrated its poor carrying quality. The berry is very large, the clusters medium and compact, the flavor good. It drops from the cluster somewhat and bruises easily, quite as easily as the Concord, we should judge, but is doubtless one of the valuable early grapes for private planting on a small scale.

**Prizes at Fairs for Trotting Horses.**—Without saying a word in favor of the offering of prizes for mere speed, by our Agricultural Societies, we cannot but commend a common sense suggestion of the President of the "National Association of Trotting-horse Breeders." Instead of offering prizes for "Roadsters," "Horses of all work," etc., when the great point is trotting ability, he suggests that prizes be offered for "Standard-bred Trotters," which are registered. The Agricultural Societies would thus aid the horse-men in establishing the American trotting horse as a distinct breed, which they are now taking the proper course to accomplish—next to keeping, pedigrees cannot be too highly esteemed.

**Keeping Cider Sweet.**—The methods usually resorted to, to prevent fermentation in cider, like adding mustard seeds, suspending a piece of lean beef, the use of Sulphide of Lime, all add, more or less, a disagreeable flavor to the cider. The Preserving Powder, advertised in another column has the advantage of imparting no flavor while it is efficient and active.

### Catalogues Received.

The following are the special autumn catalogues that have been received up to the time of going to press:

#### NURSERYMEN.

**BAIRD & TUTTLE,** Bloomington, Ill. Agents for the Bloomington Nurseries. A fall wholesale list.

**CHARLES BLACK & BRO.,** Hightstown, N. J.—A special strawberry list; also peaches and apples.

**EVERETT BROWN,** Bluff Point, Yates Co., N. Y.—A special grape catalogue, offering the standard varieties.

**BUSH & SON & MEISSNER,** Bushberg, Mo., besides a grape catalogue, issue a special list of novelties which contain, among other new things, the remarkable seedlings of Mr. Rommel. This firm has established nurseries in Europe to supply the demand for American varieties.

**JOHN S. COLLINS,** Moorestown, N. J.—An illustrated catalogue of small fruits of all kinds.

**ELLWANGER & BARRY,** Rochester, N. Y.—Their autumn lists contain strawberries and small fruits generally; also a new pear, the Frederick Clapp, is figured and described.

**G. H. & J. H. HALE,** South Glastonbury, Conn.—A strawberry catalogue, with a number of new varieties.

**A. HANCE & SON,** Red Bank, N. J.—A special strawberry catalogue, with an interesting treatise on culture.

**T. S. HUBBARD,** Fredonia, N. Y.—Grape vines and other small fruits, with a colored plate of the Prentice grape.

**G. S. JOSSELYN,** Fredonia, N. Y.—A full stock of small fruits.

**JOHN B. MOORE,** Concord, Mass.—A catalogue of small fruits, "Moore's Early" grape, asparagus, etc.

**T. V. MUNSON,** Dennison, Texas.—General nursery stock, with Southern specialties.

**J. H. RICKETTS,** Newburg, N. Y., sends detailed descriptions of several of his new seedlings.

**E. P. ROE,** Cornwall, N. Y.—His catalogue of small fruits is as full as usual, and always interesting reading.

**JOHN VAN LOON,** New Amsterdam, Wis.—A choice collection of small fruits, some specialties in seed, with the *American Agriculturist* as a premium.

**G. ZIMMERMAN & SONS,** Buffalo, N. Y.—A very full list in all departments. The "Catalogue of the Pine Hill Nurseries" is a neat one in many respects.

#### SEEDSMEN AND FLORISTS.

**J. LEWIS CHILDS,** Queens, N. Y.—Catalogue of Dutch and other bulbs.

**D. M. FERRY & CO.,** Detroit, Mich.—Catalogue of bulbs, greenhouse plants, and seeds for autumn planting.

**J. M. THORNBURN & CO.,** 15 John street, New York.—A bulb catalogue; one of the fullest we have received this year; illustrated.

**JAMES VICK,** Rochester, N. Y., in the form of a floral guide, issues a very handsome bulb catalogue; also greenhouse plants, seeds for fall planting, winter bouquets, and various florist's supplies.

#### MACHINERY, LIVE STOCK, AND MISCELLANEOUS.

**ARAD BARROWS, JR.,** 1403 South Front street, Philadelphia, Pa.—Price-list of wrought iron field, lawn and garden rollers.

**JAMES BEGGS,**—Steam engines, portable forges, etc.

**JACOBS BROTHERS,** Columbus, O.—Machinery and evaporators of sorghum.

**GEORGE W. TAFT,** Abbington, Conn.—Road sprinklers.  
**JOSEPH HARRIS,** Rochester, N. Y.—Cotswold sheep and Essex pigs.

**J. C. VAUGHAN,** Chicago, Ill.—Dried flowers, grasses, baskets, etc.

#### FOREIGN CATALOGUES.

**F. C. HEMMANN,** E-furt, Prussia.—A special catalogue of new seeds.

**B. FADDER & JAHN,** Berlin, Prussia.—Papers for bouquets and for fruit plates; interesting as showing what an immense trade there is in such articles.

**FRANCIS MORTON & CO.,** Liverpool, England.—A large and well illustrated catalogue of agricultural iron work, including fencing and gates of many kinds, stack roofs, iron buildings, churches, etc.; showing to what an extent iron is employed for such purposes in England.

### The Farmer's Guide and Account Book.

How deep, how much, etc., to sow or plant 70 different articles, and the fertilizers required. Systematic farming, gardening, and accounts.—Highly commended by Ex-Gov. Horatio Seymour and the agricultural schools. Price \$1.25, and sold by booksellers generally. NATIONAL BLANK BOOK CO., 66 & 68 Duane St., New York.

**THEODORE SCHUSTER,**  
419 Herkimer Street, Brooklyn, N. Y.,  
SOLICITS ORDERS FOR  
SEEDS OF ALL KINDS, APPLE AND  
PEAR STOCKS, Etc.,

For account of MR. I. W. WUNDERLICH, in Frankfurt-on-the-Maine, Germany, and also asks for

Offers of American-Grown Seeds for Export.

**THE POPULAR PRICE LIST OF**  
Winter & Spring FALL  
**FLOWERING BULBS | SOWING SEEDS**  
AND  
**HORTICULTURAL COMMODITIES**  
FREE TO ALL.  
**A. D. COWAN & CO.,**  
AMERICAN SEED WAREHOUSE,  
114 Chambers St., New York.

**A CHOICE LOT OF PEACH, APPLE, AND**  
other Fruit Trees and Plants at Bottom Prices. Price list free.  
**R. S. JOHNSTON,** Stockley, Del.

### METROPOLITAN AGRICULTURAL WORKS.

Farm Implements and Fertilizers.

No. 1 Peruvian Guano; Standard. No. 1 Peruvian, Lobos brand.—Russell Coe's Superphosphate of Lime. Complete Manures. Metropolitan Fertilizer. Pure Ground Bone. Sold at lowest trade price, by the ton or cargo. Sent for 1880 Pamphlet.

**H. B. GRIFFING,**  
No. 70 Cortlandt Street,  
New York City.

### JOSEPH GILLOTT'S STEEL PENS.

Gold Medal, Paris, 187C.  
The Favorite Numbers, 303, 404, 332,  
351, 170, and his other styles.  
Sold throughout the World.

### The Best Farm and Family Weekly

In the country. It is pasted and trimmed, is handsome and attractive, and it is easy work to get subscribers, as the price is a mere trifle.

**13 Weeks for Only 35 Cents**

**AND A PREMIUM FREE TO EVERY SUBSCRIBER.**

We give premiums for clubs of all sizes, from 2 to 200. No trash on our premium list, and the paper is strictly first-class. Liberal inducements, also, to subscribers. It will pay you well to try.

**Don't Delay** Now is the time for this work. Send your name and address at once for sample copy and complete premium list, which will be sent free. Address

**LIVE PATRON, Springfield, Ohio.**

### WANTED

SCROLL SAWS, and SCROLL SAW DESIGNS. Most complete list ever before presented to the public. Prices to suit all. Agents Wanted.

**ORANGE JUDD COMPANY, Sole General Agents, 245 Broadway, New York.**

Every one who reads this to send us his address for a free illustrated Catalogue of Crandall's BLOCKS, TOYS & GAMES. BIL-LIARDETTE.

## NE PLUS ULTRA AUTOMATIC WINDMILLS,

Ten feet diameter of wheel; one horse power; machine made of best iron, oak and bass wood; patent duplex compensating regulator and stroke; the crowning perfection of wind engine, securing steady running in all winds and adapting stroke to elevation and quantity of water required. Of simple and solid construction, not liable to derangements;—has no traps,—is elegant, effective and durable; packed for shipment in twelve cubic feet; gross weight 40 lbs. Are capable of working a pump of 3-inch cylinder, raising water 50 feet through 1½ inch pipe, or 75 feet with 2½ inch pump and 1½ inch pipe, or 125 feet with 2 inch pump, in abundance for any farm or for two or three houses. Warranted to be in no respect inferior to any other mill in the market or money will be refunded in every case.—P. S.—Either postal order or cash must accompany all orders, or endorsement of responsible merchant of same town. Price \$50.00, less \$5 drawback to cover freights.

KEWANEE MFG CO., 35 Broadway, N. Y.

### HALLADAY

## STANDARD WIND MILL.

### VICTORIOUS AT

Phila., 1876—Paris, 1878.  
25 Years in Use.

### GUARANTEED SUPERIOR

To any other Windmill Made.

17 Sizes—1 Man to 45 Horse Power. Adopted by the leading R. R. Co's and by the U. S. Govt. at Forts and Garrisons.

\$3,500,000 worth now in Use. Send for Catalogue "A."

U. S. Wind Engine & Pump Co.,  
Batavia, Ill.

We manufacture the old reliable **Stover** the well tried, sturdy durable self-regulating, solid wheel Wind Mill, which took the Centennial Diploma, as well as a Medal. We refer to the Official Centennial Report. Also O. E. Winger's Improved \$20.00 double Feed Grinder, which is operated by pumping Wind Mills—a novel and perfect Mill for grinding all kinds of grain for stock and house use. Agents wanted everywhere. Send for catalogue B. Branch Factory at Kansas City, Mo.

**E. B. WINGER,**  
Successor to **STOVER WIND ENGINE CO.,**  
Freeport, Ill., U. S. A.

## The IRON DUKE WIND MILL is the Best and Cheapest

for the following reasons:

It is ALL IRON. Is Self-Regulating. Will pump with less wind than any mill ever made. Will not shrink, warp, split, decay, and will stand more work than any mill extant.

DON'T BUY till you have received our Circular.

**O. S. GILBERT & CO.,**  
Manufacturers, Indianapolis, Ind.

## THE CHAMPION WIND MILL POWER The Best in the World.

It is perfectly self-regulating, and presents no unnecessary surface to the wind. Pronounced by millwrights and mechanics to be superior to all other mills made. Do not buy until you have investigated the Champion. All information regarding the mill free.

**POWELL & DOUGLAS, Waukegan, Ill.**

## Porous Drain Tile.

2 to 7 inches VENT. For Prices address  
**W. M. BELL, Smyrna, Del.**

## WROUGHT IRON } - ROLLERS. FIELD & GARDEN }

I manufacture a full assortment of these articles of wrought boiler iron. On exhibition at Pennsylvania State Agricultural Fair, F to 10 For Sale by **JAMES C. HAND & CO.,** Market Street, or

**ARAD BARROWS, Jr.,**

No. 1403 South Front Street, Philadelphia, Pa.

**AGENTS WANTED EVERYWHERE** to sell the best Family Knitting Machine ever invented. Will knit a pair of stockings, with **HEEL** and **TOE** complete, in 20 minutes. It will also knit a great variety of fancy-work for which there is always a ready market. Send for circular and terms to **Trembly Knitting Machine Co.,** 409 Washington St., Boston, Mass.

## JONES Pat. Polished Steel DRILL POINTS

As ye sow, so shall ye reap.

Fit all drill bits, run level, cut the bottom furrows, cover with mellow soil, and instead of crowding the seed into narrow rows but one row in width, scatter it 3½, 4, and 5 inches; the plants thus standing wider apart, have more ROOM TO STOOL, derive more nourishment from the soil, become more vigorous, and produce better developed average heads.

Send for Illustrated Circular with Testimonials to  
**J. A. JONES, Wilmington, Del.**

"I was in my brother Tom's wheat about a week ago, and I really believe there is one-third more wheat where it was drilled with your points. Tom told me he had measured some rows and found sixty-three heads in the same length of row, against forty-two of the old way of drilling."

**H. CLAYTON** (Pres. Citizens' Nat. Bank of Middletown, Del., and farmer).

"I got five bushels to the acre more wheat where I drilled with your points than with the old style. I gave them a fair test, showing you no favor."

**JOSHUA CLAYTON, Jr., Mt. Pleasant, Del.**

"There were less small heads where I sowed with your shovels." **ALEX. UNDERWOOD, Mechanicsburg, Pa.**

"I never cut such grain before. I can not keep from praising your points." **A. H. MARR, Milton, Pa.**

"Have made the finest crop reaped since I have had the farm in hand."

**LLOYD LOWNDES, Easton, Md.**

**CHESVILLE, Washington Co., Md., Sept. 8, 1880.**  
"I started two sets of your points in my fields to-day (Nos. 4 and 5, and had eighteen visitors to see them work; you should have been here to hear the praise; they worked to a charm. I would no more think of going back to the narrow points, than I would to the wooden mould-board."

**N. SENER.**

**LEWISTOWN, Mifflin Co., Pa., Sept. 6, 1880.**  
"The No. 3 points work splendidly. My farmer and neighbors who saw them at work, are all very much pleased with them."

**W. C. BRATTON.**

**UNIONVILLE, Frederick Co., Md., Sept. 4, 1880.**  
"I started the points to-day; am well pleased with the result so far."

**WM. W. BOONE.**

## "NEW" Hydraulic Ram!

The only Horizontal Ram made. Will do good work on light fall. Send for circular.  
**ISAAC B. MILLINGTON & CO., Chester, Pa.**

## CHICAGO SCREW PULVERIZER.

### Does Pulverization pay?

**ABILENE, KANSAS, Nov. 10, 1879.**  
I seeded 3,400 acres of wheat with these machines. The stand of wheat is now the best I have ever seen on new land.

**R. J. WEYMER, Trustee.**

**DANVILLE, ILL., Dec. 4, 1876.**  
This year I harvested, on 190 acres, 6,100 bushels of wheat. In my opinion the Screw Pulverizer increased the crop one-third over what I could have got by any other method.

**D. G. MOORE.**

Send for pamphlet with cuts, and over sixty letters from men who have the machine. Address,

**Chicago Scraper & Ditcher Co.,**  
34 METROPOLITAN BLOCK, CHICAGO, ILL.

## The "Centennial" Fanning Mill.

The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover, and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers.

**STEPHEN FREEMAN & SON,**  
Racine, Wis.

**L. E. RANSOM, 31 MAIDEN LANE, N. Y. CITY.**  
Perfect Butter Color at lowest prices.

**Lion Feed Cutter,** combining the latest best improvements. Also **Gale's Feed Cutters,** both cylinder and lever, and **Belcher & Taylor's Root Cutters.** For full description, send for illustrated catalogue and price list. Address, **THE BELCHER & TAYLOR AG'L TOOL CO.,** Chicopee Falls, Mass.

## THE BELLE CITY FEED CUTTER.

The Best Feed Cutter in the World.

The only one that runs light enough for Wind-Power.

Send for circular, references, &c. Name this paper when you write.  
**DAVID LAWTON,** Manufacturer, Racine, Wis.

## Our "A. B. C." Corn Sheller

AND

## "Common Sense" Cutter

For Hay and Stalks—have taken the highest premiums everywhere. Send for Circular.

**A. B. CONU, 197 Water St., N. Y.**

## SEDGWICK BROS.,

## STEEL WIRE FENCE.

Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry, as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks, or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every respect, and far better than barbed wire. We ask for it a fair trial, knowing it will wear itself into favor. The **Sedgwick gates**, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength, and durability. Ask hardware dealers, or for price list and particulars address **SEDGWICK BROS., Richmond, Ind.**

## GALVANIZED CABLE FENCE STRAND.

The only Wire Fence that stands the test of time.

**NO BARBS.**

**PHILIP S. JUSTICE, 14 N. 5th St., Philadelphia, Pa.**

## STEEL WIRE HAY BANDS.

### IMPROVED WIRE BAND.

Patented Oct. 3, 1876.

Jan. 9, 1877.

### EXCELSIOR WIRE BAND.

Patented March 10, 1863.

Reissued March 23, 1869.

### ADJUSTABLE WIRE BAND.

Patented June 29, 1880.

## MADE OF THE BEST SELECTED STEEL WIRE.

The strongest and most convenient Hay Bands ever offered.

**WRITE FOR PRICES.**

Orders or letters of inquiry will receive prompt attention. Address

## BROCKNER & EVANS,

Sole Manufacturers. Importers of Galvanized Wire Nettings and Sheep Fencing. Dealers in Patent Steel-Barb Fence Wire.

**422 West Street, New York City.**

## HANSEN'S DANISH LIQUID BUTTER COLOR!

Has taken **Thirty Highest Prizes, three Gold Medals** at World's Fairs. Is prepared in vegetable oil, used to color the finest butter made in Europe, and fast superseding all other coloring in America. Does not color the buttermilk, makes butter beautiful, greatly enhances its value. No alkali used. One dozen bottles, with directions for making finest butter, free to druggists or dealers. **HANSEN'S LIQUID CHEESE COLOR and LIQUID EXTRACT OF KENNET:** No Manufacturer or Repacker of Butter can afford to neglect these Danish preparations. **GANG PRESSES and SELF-BANDAGING CHEESE HOOPS:** All royalties paid by us. **\$625 CASH PREMIUMS** at late International and State Dairy Fairs for very best Apparatus for Manufacturers of Butter and Cheese. Acid Butter-milk, and Skim Milk saved. **"ANTI-HUFF" EXTRACT,** a great success, makes finest Skim-Milk Cheese. Send for new Circular. **WHITMAN & BURRELL, Little Falls, N. Y.**

**Rectangular and Square BOX CHURNS**  
Cheapest and Best. No inside fixtures, and always reliable. Six sizes of each kind made. Three sizes of the **Lever Butter Worker** made. Best material used, and every Churn and Butter Worker warranted exactly as represented. One Churn at wholesale where we have no agent. Send Postal for Circulars. **AGENTS WANTED.**

**CORNISH & CURTIS, Fort Atkinson, Wis.**

**REID'S Creamery.**  
The simplest, best, and most convenient yet invented.  
**AGENTS WANTED.**  
Send for circular to  
**A. H. REID,**  
6 N. Eighteenth St.,  
Philadelphia, Pa.

## BUTTER WORKER.

**Lilly's Patent.**  
Won First Premium at the American Institute Fair, New York, in 1878; at the Fair of the Penn. State Agricultural Society in 1879; at the Dairyman's Fair at Delhi, N. Y., in 1879, and at County Fairs innumerable. Acknowledged to be the only self-feeding and reliable machine in the market. Descriptive circular sent free.

**C. H. R. TRIEBELS, 316 Race St., Phila, Pa.**

## HOUSE-KEEPERS, ATTENTION!

**THE GLOBE WASHBOARD AND THE IMPROVED UNION CHURN**

Are the best in the world. Neither have any equals over 600,000 **Globe Washboards** sold in 1879. No more sore hands or torn clothes on inferior washboards. Buy it and try it. The Improved Union Churn is the perfect butter-maker. Easier and quicker than by any others. One trial will convince any one of the fact. Send for circulars with full details. Liberal terms to dealers.

**UNION MANF'G CO., Toledo, Ohio.**

## NOVELTY INCUBATOR.

I offer this as the simplest, cheapest, and best Incubator in the market. Costing less than 8 cts. per day for oil. Hatches 80 to 90 per cent almost surely. Holds 100 Eggs. Price, 30.00, ready for shipment.

A monthly magazine, the oldest, largest, and best periodical devoted entirely to poultry ever published. Splendidly illustrated. \$1.25 per year. Also the **American Poultry Yard**, the only weekly paper devoted entirely to poultry in existence. \$1.50 per year. Both papers for \$2.00. A sample copy of both mailed on receipt of nine cents in postage stamps. Address **H. H. STODDARD, Hartford, Ct.**

## THOROUGHbred and CROSS-BREED OR GRADE JERSEY STOCK.

5 fresh cows, 4 to 8 years old, with or without calves.  
5 thoroughbred Jersey Bulls, 1 to 5 years old.  
5 Heifers, 8 to 11 months old.  
At the above are, or can be registered in the A. J. C. Club Register. 25 cross-bred heifers and cows 2 to 7 years old. These are a mixture of the two breeds, Jerseys and Ayrshires; several are now fresh, and the balance within the next two months. The best family cows ever bred, all rich milkers and butter-makers; some of them 2 lb. cows, beautiful in form and colors. Orders solicited for calves of either breed, deliverable when weaned and ready to ship at 2 to 3 months old. My prices range from \$45 for a high grade heifer calf, to \$400 for my best thoroughbred cow and calf. April, 1880. **THOMAS FITCH, New London, Conn.**

## CRANDALL'S TREASURE BOX.

This is one of Crandall's latest and best inventions. It is not one toy alone, but a dozen in one, comprising a Wagon, Top, Bedstead, two Chairs, Wheelbarrow, Mallet, Bench, Table, Puzzle, Set of A B C Blocks, a group of nine Domestic Animals, and a pretty Suburban Village. A most delightful combination for the little folks.

Price, \$1.00. Expressage to be paid by the recipient.

## WHISTLING LOCOMOTIVE.

This new Toy is a marvel as to its simplicity. At every revolution of the "driving wheels" there is produced a good, strong whistle, which adds greatly to the liveliness and interest of the Toy, and gives much pleasure to the boy or girl—the young engineer who runs it. It is finely painted, and it can be easily seen, from the dimensions as given, that there is a great deal in it for a \$1.00 Mechanical Toy.

Price, \$1.00. Expressage to be paid by the recipient.

## CRANDALL'S DISTRICT SCHOOL.

Every child, and man and woman too, will laugh over this group of teacher and scholars in the "district school," and thousands of parents will recall with great delight their own experiences in childhood. The grave "master," seated by the desk, with his "whisking stick"; the boys and girls with their books; the "little lamb" that has followed his young owner into the school; the "dunce" and his cap, and the altogether comical appearance of the whole company, make this one of the most attractive toys of Crandall's invention.

Price \$1.00; by mail, prepaid, \$1.20.

## Winter Greeneries AT HOME.

By REV. E. A. JOHNSON, D.D.,

Author of "Half-Hour Studies of Life," etc., etc.

## NOTICES BY THE PRESS.

The many who have admired its plant embowered windows and vine-covered walls as they have passed the modest residence of the author of this little treatise, in Allegheny City, will at once concede his pre-eminent fitness to give instruction in the care of plants in the house. The contents of the volume were originally embodied in a series of letters to a number of his young friends, and they proved of so great service to them, that they urged their publication. The information is imparted in an engaging style, and is of a simple and practical sort.

The United Presbyterian (Pittsburg, Pa.)

"Winter Greeneries at Home" is a very neat little work by Rev. Dr. Johnson, of Allegheny, Pa., devoted to Window Gardening, and largely the fruit of the author's successful experience in thus beautifying his own residence. The culture of flowers in an ordinary dwelling requires a loving care, and perhaps a native tact, not always purchasable with the best and most practical of books, but such volumes are calculated to develop these qualities where they have hitherto been latent, as well as to supply the place of much tedious experience, and obviate the dangers of many trying failures on the part of others. Country Gentleman, (Albany.)

In writing this volume, Dr. Johnson has told the secret of beautifying our homes in winter time. If one were to enter

his study he would find there an illustration of success in this art. The knowledge is communicated in a fine and familiar way that brings teacher and pupil into sympathy with each other, and makes the study a delight.

Congregationalist and Boston Recorder.

The book itself is a little beauty, containing over one hundred pages of letter press, with quite a number of illustrative engravings, and can be had post-paid, from the publishers for one dollar, and for those who want to get all the practicabilities of the subject in the shortest time and with the least labor, it will prove a treasure indeed.

St. Paul and Minneapolis Pioneer Press.

People who are desirous of beautifying their homes, will find the little book on Window Gardening, by E. A. Johnson, specially useful and suggestive. It tells what plants to select, how to plant and take care of them, and how to arrange them in the most artistic ways for effect. The illustrations show how a few properly arranged plants at a window may be made to adorn a room, giving it a delightful summer aspect through the winter months.

Commercial Advertiser (Buffalo, N. Y.)

It is a complete manual of Window Gardening, containing full directions for the propagation and care of house plants. To those who desire the luxury of winter-blooming plants, this book will be of the first importance. Indiana Farmer.

"Winter Greeneries at Home," by Edwin A. Johnson, D.D., is a little book on Window Gardening, designed to meet the need of ordinary, unprofessional cultivators of flowers and plants for the house. It gives about all the information needed for successful Window Gardening.

New York Evening Post.

It contains, in a small compass, a great deal of information respecting the treatment of in-door plants during the winter months, based on the experience of years.

Evening Transcript (Boston.)

PRICE, POST-PAID, \$1.

## THE Window Flower Garden.

By JULIUS J. HEINRICH.

HANDSOMELY ILLUSTRATED.

Mr. Heinrich is a practical florist, and this entertaining Volume embodies his personal experiences in Window Gardening during a long period. All persons who desire to beautify their homes, and make them attractive and cheerful, particularly during the winter months, should have this book. The Author has made every thing so clear and plain, that any one who follows the directions, can easily and readily master the art of Window Gardening. The numerous illustrations, numbering more than seventy, add very materially to the attractiveness and value of the work.

## CONTENTS:

Introduction.—CHAPTER 1. The Soil.—2. Pots.—3. Saucers for Pot Plants.—4. Pot Mats.—5. The Location of the Window.—6. Fitting up the Window for Growing Plants.—7. Building a Conservatory.—8. Designs Made of Dried Everlasting Flowers, etc.

12mo. Cloth. Tinted Paper. Price, Post-paid, 75 Cents.

## The Shepherd's Manual.

A Practical Treatise on the Sheep.

Designed Especially for American Shepherds.

By HENRY STEWART.

ILLUSTRATED.

The first edition of this Manual has been so well received, and the letters acknowledging indebtedness for assistance derived from it have been so many and so emphatic, that the author has the best of reasons for presenting this new and enlarged edition to the public. It is intended to be so plain that a farmer, or a farmer's son, who has never kept a sheep, may learn from its pages how to manage a flock successfully, and to be so complete that even the experienced shepherd may gather some suggestions from it. The author feels, with enlarged experience since the first publication of the volume, that he can still more confidently than before encourage the young shepherd to accept this Manual as a guide and a counsellor.

PRICE, POST-PAID, \$1.50.

Either of the above books sent post-paid on receipt of price, by

ORANGE JUDD COMPANY,  
245 BROADWAY, NEW YORK.

# The Champion REAPERS & MOWERS.

THE ACKNOWLEDGED MONARCHS OF ALL

## Grass and Grain Cutting Machinery,

And fully Endorsed by Agricultural Mechanics as the Most Wonderful Machine ever Invented.

TWO IMPORTANT ADDITIONS.

### THE LIGHT SINGLE REAPER.

This new Reaper weighs only 750 pounds, cuts a full swath, and is strong and substantial in every respect. While the draft is light, the Machine is in every way adapted to difficult work, and is capable of withstanding the severe usage to which a Reaper is frequently subjected.

### THE AUTOMATIC CORD BINDER.

It can be safely said that this Binder has advanced to the highest point of perfection yet attained in binding machinery overcoming many of the difficulties which have been so serious in efforts heretofore made, and reducing to practical use a machine for binding grain.

The **CHAMPION REAPERS AND MOWERS** will be on exhibition this fall at most of the County, District, and State Fairs, and Expositions throughout the United States and the British Provinces. While examining the old standard machines, at the Fair, don't fail to inquire after the new candidates for public favor.

Every Inquiry promptly answered by addressing either of the following Manufactories or Branch Houses:  
**Whiteley, Fassler & Kelley, Springfield, Ohio,** 19 South Market St., Boston, Mass., or Schenectady, N. Y.,  
**Champion Mowing Machine Co., Springfield and Cincinnati, Ohio,** St. Louis, Mo., Omaha, Neb., St. Joseph, Mo.,  
**Ward, Mitchell & Co., Springfield, Ohio,** and Chicago, Ill.; and the **Toronto Reaper and Mower Co., Toronto, Canada.**

**ROYAL**  
FULL WEIGHT  
ROYAL BAKING POWDER  
ABSOLUTELY PURE

**BAKING POWDER**  
Absolutely Pure.

Made from Grape Cream Tartar.—No other preparation makes such light, flaky hot breads, or luxurious pastry. Can be eaten by dyspeptics without fear of the ills resulting from heavy indigestible food.  
Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO., New York.

4 " " " 280.00

6 " " " 370.00

Put on Cars at Springfield, Ohio.

**JAMES LEFFEL & CO.,**

Springfield, Ohio,

or 110 Liberty St., New York City.

**NEW CHAMPION**  
Single Breech-Loading  
**SHOT GUN.**

Retail Price.—Plain Barrels, 12 bore, \$14.00; Plain Barrels, 10 bore, \$15.00; Twist Barrels, 12 bore, \$17.00; Twist Barrels, 10 bore, \$18.00. The frame and trimmings of all these guns are Nickel Plated. This gun possesses many advantages over any single breech-loading gun yet produced in this country. It has a patent side-snap action with a safety attachment, by means of which it can be opened only when the gun is at half-cock, thus ensuring perfect safety in loading. The workmanship and materials used are first-class; no gun being allowed to leave the factory until it has been thoroughly inspected. We take great pleasure in offering this gun to the public, and feel safe to say it is the best American Single Breech-Loader yet produced. Send stamp for Illustrated Catalogue of Guns, Rifles, Revolvers, and Shotguns. Address **JOHN P. LOVELL & SONS, Gun Dealers, Boston, Mass.**

### Spiral Spring Single Trees

Price, \$3.50 per pair. Where we have no agents, we will send a sample pair on receipt of \$2. Send for circular. Local Agents wanted. **F. R. Willson & Sons, Columbus, Ohio.**

TO KEEP IT SWEET **CIDER** or prevent Secondary FERMENTATION, USE **IMPROVED PRESERVING POWDER**

It does not impair the taste or flavor, is thoroughly reliable and absolutely harmless to the human system. SEND 35 CTS. for a sample, forwarded free, sufficient for 40 gallons. SIX YEARS.

This Organ Contains

BEATTY'S  
Patent Stop  
ACTION,  
14 STOPS,  
4 SET  
REEDS,  
SUB BASS  
AND  
OCTAVE  
COUPLER.

The Celebrated Vox  
Celeste and Vox Hu-  
mana Stops are used  
in this Organ.

Names of Stops.

- (1) Diapason Forte,
- (2) SUB BASS,
- (3) Principal Forte,
- (4) Dulcet,
- (5) Diapason,
- (6) GRAND ORGAN,
- (7) VOX HUMANA,
- (8) Æolian,
- (9) Echo,
- (10) Dulciana,
- (11) Claironet,
- (12) VOX CELESTE,
- (13) OCTAVE COUPLER,
- (14) Flute Forte.

Style, No. 5000. Dimensions: Height, 72 inches; Depth, 24 inches; Length, 46 inches; Weight, boxed about 400 lbs.

It is Five Octave, fine Walnut Case of handsome appearance, built plain but very neat, so it will not take the dirt or dust. It contains the celebrated Vox Celeste Stop, which is the sweetest toned and most perfect stop ever placed in an organ, also the Vox Humana Stop, the Grand Organ Right and Left Knee Swell, (4) Four Set of Golden Tongue Reeds, as follows: A set of powerful Sub Bass Reeds, Set of 3-Octave of Vox Celeste, and 2-1/2 Octave each of Regular Golden Tongue Reeds. Besides all this it will be fitted up with an Octave Coupler, which everybody knows doubles the power of the instrument. Lamp stands & Pocket for Music. It has a sliding lid & conveniently arranged handles for moving. Its bellows, which are of the upright pattern, are made from the very best quality of Rubber Cloth. Of great power, and are fitted up with steel springs and the best quality of pedal straps. The pedals instead of being covered with carpet, are made of metal, of neat design, and never get out of repair or foot-worn, like carpet.

This Organ is built expressly for parties who don't want to pay a high price, but want plenty of Music in a plain, substantial case.

I will box and deliver the above Organ on board cars at Washington, N. J. with Stool, Book and Music, for only \$65.00. Please send reference if you do not send money with your order. Remember you are under no obligation.

(Not even freight charges.) To keep the organ unless it is just as represented in this Advertisement, as it will be shipped to you on three to five days test trial. And after you decide to keep it, I will then send you a written warranty for six years.

Illustrated Catalogues and Newspaper, Holiday Edition, sent FREE. Address, DANIEL F. BEATTY, Washington, New Jersey.

Please Post above Advertisement in a Conspicuous Place.

NEW SERIES—No. 406.

TAKING THE THANKSGIVING TURKEY.—DRAWN BY W. M. CARY.—Engraved Expressly for the American Agriculturist.

Instituted by the Pilgrim Fathers as a day of prayer and praise in memory of the bountiful crops of the first harvest in their new home, Thanksgiving Day has grown with the nation's growth, and become a National Holiday. It was originally a farmer's festival, but now the observance has become so general that the home that is not upon the farm is none the less the scene of thanksgiving joys and praise. One of the most attractive features of this memorial day is the gathering of the scattered members of the family at the old home, there, under the parental roof, to give hearty thanks to the Giver of all good for the ingathered crops, and the great blessings of national growth and prosperity. To many of us Thanksgiving means a feast of the fat things of the land—the best pumpkin made into the best pie, and the finest turkey of the flock served up with cranberry sauce, and all the good things that go to make the feast complete. Thanksgiving Day and turkey

have been associated together so long, and that for excellent reasons, that it seems as if the noble bird would almost know the day appointed by the President for his dissolution. From the time he is hatched out of the speckled egg, through his early confinement in coops and pens, and later, the wider range and roaming over the fields—through all this time, every act of kindness and care shown him by his owner is prompted by the amount and sweetness of the meat he will put upon the platter at the "Thanksgiving Dinner"—the center-piece of the loaded board. In the accompanying engraving the artist shows us one of the last scenes in the tragic life of the fated turkey. It is doubtless Thanksgiving eve—the night before the feast. With one or two exceptions, all the turkeys of the flock, save those reserved for the next season's breeding, have been sold and are already dressed and in the market. The hour has come for the exceptional turkey—the largest one of them all, it may be; watched

and fed with more than average care, because selected weeks before for the part he is soon to play at the joyful reunion of his owner's relatives and friends. The engraving shows how, in many a farm-yard, the boys and the lantern go forth to catch and kill the fat and innocent bird. "Thanksgiving" is preëminently a home festival, and though as yet a distinctively American institution, it deserves not only to be preserved to us with all its sacred recollections, but it or some similar custom should be spread throughout every land where the ties of family friendship prevail. For the past few years we have been blessed with full crops, and at no time in the history of our Republic have we had more reason for hearty rejoicing than at the close of 1880. We hope the day will be observed by every member of the great *American Agriculturist* family, whether he dwells in New England, the birth-place of the institution, or on the frontier, where the thanks perchance may be for the first harvest from his land.

## AMERICAN AGRICULTURIST.

NEW YORK, NOVEMBER, 1880.

## Hints for the Work of the Month.

[The Hints and Suggestions in these columns are never copied from previous years, but are freshly prepared for every month, from the latest experience and observations, by practical men in each department.]

The Season throughout the Northern States is likely to be variable. We may have Indian Summer, and we are quite sure to have hard frosts, storms, and snows. All these vicissitudes are to be provided against, and taken advantage of.

The Harvesting of Root Crops is to a great extent accomplished this month. Potatoes, by the first week of November, are, or should be, all out of the ground, except possibly south of Pennsylvania and along the coast. If the ground freezes, some are inevitably injured by the severe cold.

Beets and Mangels are protected by their broad leaves (from frosts) which would otherwise injure them so as to cause decay; but as soon as the leaves are wilted the growth of the root is checked, and they should be harvested and pitted at once. The same is true of Carrots. They bear very little freezing, and the frosting of the leaves is the signal for rapid gathering. One of the most convenient methods is to plow a furrow close to the row—and run a subsoil-plow close on the other side, as shown in the accompanying engraving. The carrots may then be pulled unbroken, and with perfect ease.

LOOSENING CARROTS WITH A SUBSOIL-PLOW.

Turnips may be left longest before digging, but repeated freezing makes them pithy and innutritious.

Pitting Roots.—Trenches four feet wide and two feet deep are of a size well suited to either a moderate or severe winter. If put in too large heaps, or too deep pits, roots heat, and of course do not keep well. Cover with straw, and lightly with earth patted down to shed rain, and ventilate well.

Root Tops and small roots may be fed to cows and young stock quite freely, before they heat, which they will do quickly if in heaps. It is well to lay them on the north side of some building, where they will not become sun-dried, for thus they will be kept much longer than in any other way.

Soft Roots and hollow ones, which cannot be pitted, are profitably fed to either pigs, sheep, or young cattle, and also to cows that are dry.

Neglected Work.—Should any of the proper work of last month have been neglected, such as sowing winter grain, husking corn, etc., it may perhaps still be done. Corn-husking may be done at any time. Rye may be sown as long as there is a prospect of a fortnight of open weather. Wheat sown in November often does well, so if the ground is prepared your plans need not be changed, for the probabilities are in favor of good crops, though late sowing has nothing to recommend it.

Thrashing must be done generally when you can get the thrasher—so it is well to speak for it in season. The sooner grain is thrashed the more there will be of it. It should, however, be thoroughly dry. Small farmers will improve rainy days as they come by thrashing by hand. Besides this suitable

Rainy-day Work is painting and cleaning of tools, oiling and mending of harness, cutting kindling wood and such like jobs common upon every farm.

Manure and Compost.—The season is still favorable for the growth of the compost heap. Weeds and all sorts of hedge-row rubbish ought to be burnt, for the seeds are ripe, and we can not depend on their germinating in the compost heap. Grassy sods, the tops of the roots which can not be

fed out, leaves, and wood or swamp mould, and all such things add both bulk and value to the heap.

Draining upon upland may now be prosecuted more conveniently than at any other season of the year. Labor can be hired cheaply, and the work can be rushed if desirable. Never lay these drains less than three and a half feet deep, if it can be helped. See article on levelling and laying the tile in the March No., *American Agriculturist*, page 97.

Ditching.—Should the season continue dry, ditching in the swamps is in order. In muck swamps dig the main ditches deeper and broader than necessary, say two or three feet wide at the bottom, and eight or ten at the top, and throw out the muck on one side to lie and freeze until spring, while the tussocks and sods are thrown by themselves, to be burned next summer when thoroughly dry.

Poultry.—The Poultry year culminates this month. With plenty of corn, and something to pick up in the fields, poultry increase rapidly in weight, and should be forced so long as the weather remains moderate. When the thermometer goes lower and lower, they will stop gaining suddenly, and hardly hold their own, though consuming more feed. Of course that would be the time to kill if every body would not kill at once. Those who have warm, airy houses for their poultry can profitably hold on to them until the reaction comes and prices rise; but those who watch the market may take advantage of fluctuations as they come at any time.

Buildings may be repaired and painted, if that has not been already done. The season is favorable for painting, as very little dust and no insects are likely to adhere to the paint.

Horses, though they may still be kept at pasture, if desirable, should have a shed at least to retreat to during hard storms. Do not work them at all on the road if they have colds or the prevalent influenza, absurdly called "epizooty," the best cure for which is a warm, airy stable, and perfect rest, although they ought to have a good run in the pasture during the warmest part of every day.

Cows which are giving milk must have an increase of feed. Mangels, or sugar beets, are best. Cut them in slices, and sprinkle them with bran, and feed half a bushel more or less at a time, after the cows have filled themselves with hay or corn, fodder or grass. Soft turnips may be fed to some cows at milking-time, and not flavor the milk. Keep up the flow of milk, if possible, especially with young cows, by feeding meal, bran, and roots.

Burning Brush and Rubbish.—Where this has been cut along the fences on the road, or between fields, late in the summer and is now dry, burn it, and spread the ashes on grass land. It only harbors vermin, mice, rabbits, and insects.

Fence Rows.—There is no better season than this for cleaning up fence rows. Take the fence up altogether. If you need a fence, set it up again a rod away with the tops of the posts on the ground and the butts in the air (supposing it to be a post and rail fence), supporting it by forked stakes against the posts, as shown in the accompanying

A TEMPORARY FENCE.

This leaves all clear, and the old ivy-grown, briary, weedy, stony strip can be grubbed and plowed and cleaned up, sowed to grass, and the fence replaced. It is no great job, and if forty rods a year could be treated in this way every year, it would soon make a difference in the looks of most farms that would be much for the better.

*Young Stock* need not be housed until real cold weather sets in, but they should have a warm shed to lie in at night, and be kept in first-rate condition through this month with turnips, fed tops and all.

*Sheep* bear more exposure than any other of our domestic animals (not even excepting horses, not worked) that is, exposure to the weather, but not without shelter from storms. The ewes ought to be in lamb by this time, and must be kept doing well. Half a pint of corn a day each will go far towards keeping them in good condition. Weed out all those which show signs of weakness, have poor teeth, etc., and fatten them if you can.

*Pigs*.—It is much better to kill early than late. As soon as cold weather comes on, pigs will gain very little, if any, and often lose during cold storms. Therefore, crowd them if not fat enough to kill. Feed occasionally pulverized charcoal, to keep their digestive functions in tone; keep them clean and warm, and coax them to eat every ounce possible.

*Poultry* need to be treated much in the same way. That is, fattened and killed early, if intended for market. Though prices usually go up steadily after the first of January, yet the additional cost of fattening in December, or of holding poultry after it is fat, is but rarely paid for by the higher price. Warm quarters are essential to winter laying.

### Notes on Orchard and Garden Work.

This month brings the orchardist and gardener to the close of one year's work, and to the beginning of another. While he is occupied with the storing and sale of the crops that have been gathered this season, he must lay plans, and make preparations for the season and the crops to come. The spring is short and the work then to be done so great, that it is the most hurried season of the year. This shortness and pressure of spring time is in a measure compensated for by the comparative length and leisure of autumn, which allows one to do much of the so-called "spring work" well in advance. So gradual is the approach of winter that frequently the work suited to October may be carried on until well in December, in which case the Notes about fall work given in October apply with equal force during the present and next month.

### Orchard and Nursery.

*Fall Planting*.—Late October and early November are often very favorable to the planting of trees. The soil is still warm from the accumulated heat of summer; it is rarely too dry, and if properly drained not too wet. If in planting we cut, as we should, every broken root back to a sound place, in a short time these roots will have overcome the bad effects of the removal, and will be ready for vigorous growth in the spring. South of 40°, in most years, planting may be done during the greater part of the year without any injury to the newly set trees.

*Young Trees* planted this fall, or even last spring, should have earth drawn up around them, making a mound 12 to 18 inches high. This mound of earth should be free from sods, and weeds, and will serve the double purpose of a support to the trees against the winds, and prevent the mice from gnawing them.

*Drainage*.—Water should not be allowed to collect on the surface; a few furrows in the right place will carry it away rapidly. Underdrainage, to be the best and most economical, should be all finished up before hard freezing weather sets in.

*Cions* may be cut as soon as the leaves fall, and should be packed in saw dust or sand, and kept in a cool place. Select only from thrifty trees of the best varieties. If you do not have them it is better to buy than to use second-rate stock.

*Labels* upon trees should be looked to, that they do not get lost or become illegible. The old kind of pine label, marked with lead pencil while a coat of white paint is fresh upon it, is about the best. Zinc strips are used and preferred by some.

*Seeds of Trees* for planting in the spring are best preserved in boxes of sand, the boxes being kept in a cool and dry place, out of the reach of mice.

*Stocks for Root Grafting*.—The grafting of roots is done during the winter and the stocks should be

in a handy place. Take up the stocks before the ground freezes, assort and tie them in bundles, afterwards put in boxes, and place them in the cellar.

*Rabbits* if left to themselves can do much harm. A protection of the trees may be made of lath, or tarred paper may be tied about the trunk with fine wire. Smearing the trees with blood will keep away the rabbits, as meat is very distasteful to them. A fat rabbit in November is good eating, and a small bounty will induce the boys to trap and otherwise secure many of these injurious animals.

*Manuring*.—The orchard needs to be fed as well as any other field when a yearly crop is removed. Circumstances will determine the kind of manure to use. That from the stable is always in order; good bone, ashes, green crops turned under, are all of great value, and one or more should be used.

*Keeping Fruit*.—The cellar of the house, if possible, should not be used for storing large quantities of fruit, but if used there should be ample ventilation to carry off the carbonic acid produced by the ripening fruit. A uniform temperature of about 40°, or just safely above freezing, accompanied with a dry atmosphere, is the best. Pears should be stored in drawers where they can be inspected occasionally. Apples, if properly picked and packed in barrels, ought to keep undisturbed.

*Make all Snug for Winter*.—Clear up all rubbish in the orchard.... Pick up the refuse fruit and feed to the pigs, that the contained insects may be destroyed.... Fences and gates, especially of young orchards, need to be cattle proof at all seasons.

### The Fruit Garden.

*Currants and Gooseberries*.—The material used in the propagation of currants and gooseberries are the pieces removed from the bushes at the time of pruning. The bushes should be pruned so soon as the leaves fall—a month or so ago—though many put it off until much later. In making the currant cuttings, use only the growth of the present year, cutting it into six-inch lengths. The cuttings should be set quite close together in boxes of earth, the soil being deep enough to allow the cuttings to be two-thirds beneath its surface. The boxes are to be set in the cellar and kept dry during the winter, and in the spring the cuttings should be put in trenches four inches apart in the rows.

*Blackberries and Raspberries*.—The dead stems were cut away soon after the berries were off. If not done then, through neglect, do it now, and tie up the new canes for the winter. Tender varieties must be covered this month. This may be done rapidly by two men, one bending the canes down in the direction of the row, while the other throws earth upon them, either in sufficient amount or only to hold them down for the covering plow soon to follow. New plants of raspberries and blackberries are usually supplied by suckers, allowed to grow for the purpose. Roots may be cut from the old plants without injury. These root-cuttings, three or four inches in length, are then placed in layers, in boxes of earth, and stored in the cellar. The cuttings are set in open ground in early spring.

*Grapes*.—The sooner the grape vines are pruned, after the leaves are off, the better. Young vines, set last spring, should bear one or two shoots—if the present growth is half an inch thick, two shoots may be left. Cut the vines back to three buds or so, leaving extra ones to provide against accident. There is no rule for pruning old vines; the condition of each vine must determine it. Leave enough buds to produce sufficient shoots to bear leaves and fruit clusters. The buds left after pruning represent the new growth of next year. The cuttings are made from the prunings, and should have two buds at least; tie them in bundles, label, and cover in earth in the cellar. Many varieties, like the Concord, grow rapidly from such cuttings, when planted in the open ground in spring; others, with harder wood, as the Delaware, are best raised in propagating houses with special care.

*Strauberry* plants should be covered before freezing weather sets in. Straw, salt or marsh hay, or leaves may be used, placing the material thickly between the plants, but only lightly directly over the plants, as too much covering smothers them.

### Kitchen and Market Garden.

Should the present month be a mild one, many of the October Notes will be seasonable now, and to avoid repetition we refer the reader to them. In a nutshell: Do now whatever the weather will permit. So soon as a crop is off plow up the soil and leave it without harrowing, as the exposure of the ridged surface to the weather improves its texture.

*Asparagus*.—Cut and burn the tops and give the bed a generous covering of well rotted manure.

*Celery* should be dug and stored before the ground freezes hard. A trench is dug in a dry place, a foot or so in width, and deep enough to bring the tops on a level with the soil. Place the plants in it close side by side with no earth between. Cover slightly with straw or leaves, and as the cold increases add more covering until it is a foot thick. Boards may be put over the straw, lengthwise of the trench, to keep out the rain, and make it easier to get at the celery if there is snow on the ground.

*Cabbages* may be left out until heavy frosts come, when they should be pulled and placed heads down in rows, and the heads covered with a few inches of earth. A plow may be used in covering them; two furrows being turned over the heads, doing most of the work. For a small lot a common method is, to dig a trench in a dry place, set the cabbages in the trench, close together, and cover at first with a little straw. As the weather gets colder put on more straw, and as the winter sets in complete the covering with more straw and a layer of boards over the whole. Soft cabbages, if planted in this way, will come out in fine condition.

*Parsnips*.—A portion for present use may be dug and stored in sand in the cellar, the rest can remain in the ground as freezing improves them.

*Parsley* may be grown for winter use in the kitchen where there is no greenhouse, by means of a keg with a number of holes bored in its side. A crown of parsley is put at each hole, the roots extending into the sand inside the keg, while the tops grow out of the holes. Place the keg in a sunny window, and properly watered it will give a supply of parsley and make a cheerful kitchen ornament besides.

*Carrots and Beets* should be dug before they have been frozen, and stored in the cellar or root pit.

*Turnips* are not much injured by frosts, and may be left until all of the more tender garden vegetables are cared for, after which they should be dug and pitted, or put in the vegetable cellar.

*Cellars* containing roots should be kept cool or the roots will shrivel and lose much of their fresh-

A ROOT CELLAR WITH BARRELS.

ness. Where the roots are put in small pits, it is convenient to use barrels, as shown in the engraving.

*Cold Frames* are for protecting the plants in a dormant state through the winter—not for growing them. The sashes should not be put on until the freezing weather sets in. Tilt up the sashes whenever the temperature of outside will permit this, giving a circulation of pure air among the plants.

### Flower Garden and Lawn.

*The Lawn* should go into winter quarters with a good length of grass to serve as a mulch and protection. If manure is used as a top dressing, only that which is thoroughly composted and free from seeds of weeds should be applied. It may be put on at any convenient time during fall or winter.

*Leaves*.—The lawn and paths should be raked after the leaves have fallen, and the litter thus gathered used for protecting tender plants. This raking improves the looks of the grounds as well as secures a valuable covering for plants.

*Perennia* Weeds, like dock, plantain, etc., should be removed from the lawn when the ground is soft from the autumn rains. A long chisel with a handle is handy in removing their roots from the soil.

*Evergreens* show to the best advantage at this season of the year, after the leaves of the deciduous trees have fallen. A diversity of form and variety in shades of green, are pleasing, and can be obtained with care exercised in the selection of the plants, their location, grouping, etc., and pruning.

*Beds and Paths* may be laid out, and much of the work upon them done at this season of the year.

*Winter Protection.*—A few evergreen boughs, sufficient to break the winds, and afford shade, are found to answer the purpose of protection, avoiding the danger of smothering the plants which often resulted from the old way of covering with a thick layer of straw, closely packed about them.

*Bulbs* to be housed for the winter should go in before the ground is frozen. The hardy ones, like the Hyacinths, Tulips, etc., should be planted early.

### Greenhouse and Window Plants.

*Insects*, when found on the plants, should be destroyed at once by using tobacco water, soap suds, etc. Plants, if neglected, may be ruined in a short time. Success in the fight with insects depends largely upon one's promptness and perseverance.

*Climbers*, like English Ivy, Tropæolum, German Ivy, etc., add very much to the beauty of a greenhouse or window. Select the plants now.

*Hanging Baskets* should be placed where they can have an abundance of light and sunshine, and not near the stove or register. If the light comes from one side, the basket ought to be turned every day.

*Watering.*—The successful culture of house plants depends largely upon the care in watering. The pots should have some pieces of broken pots or oyster shell put in the bottom to provide proper drainage; with good drainage there is but little risk from over-watering. A thorough wetting when water is needed, is far better than keeping the surface moist, by frequent "sprinkling." Hanging baskets may be dipped into a tub of water.

*A Gradual Change.*—We should have much fewer complaints of failure with house plants if they were less subjected to sudden changes, both when they are brought in from their summer out-of-doors, and while in the house in winter. When the air of the room is changed it should be done without allowing a cold current to fall upon the plants.

### Bee Notes for November.

BY L. C. ROOT.

**WINTERING THE BEES.**—In most northern sections, bees that are to be kept in-doors should be placed in winter quarters during the present month. Those to be wintered out-of-doors, should be properly packed and protected. We have so often described, in our previous Notes, the proper manner of preparing bees for out-of-door wintering, as well as a suitable place in-doors, that we shall omit it at this time; and besides every bee-keeper who needs a detailed description should have the necessary information at hand, in some practical work, where it is given much more minutely than we could do in the space allotted here. I simply wish to say that the subject will require the closest attention and study if success is to be attained, as perfect success in wintering is yet far from being established even with the most thorough bee-keepers. A system of wintering, by which one shall have none but good strong stocks in the spring, will go farther in insuring a profitable season than any thing else connected with bee-keeping.

**HONEY.**—Now that the bees are comparatively idle, we may well consider some general questions of interest to all. A correspondent says: "I have had a number of persons ask me about how bees make honey. Also concerning the relation of feeding sugar to honey-making. Does the sugar become honey, or is it changed to honey by the bees?"—These inquiries are evidently made by parties who are practical bee-keepers, and are of very much interest to all classes. When it is remembered that bee-keeping although yet in its infancy, is becoming a very important industry, and that honey is produced by hundreds of tons each season we see that the public, who are the consumers, may well desire to know something of the subject. In answer to the first question, correctly speaking bees do *not* make honey, they simply gather it. We have endeavored, in our Notes heretofore, to

give an idea of the different classes of blossoms from which bees gather honey most freely. It is well known that honey varies in color and quality. It will be found that these variations are according to the different sources from which it is obtained. For instance, the basswood, or linden tree, blossoms very freely, and yields honey of a superior quality in great abundance. The largest part of the best and whitest honey placed upon our market is gathered from these blossoms. Later in the season, buckwheat, which is also a free bloomer, yields honey abundantly, but, unlike the basswood, it is of a dark color and entirely different flavor. There is as marked a contrast in these two qualities of honey as there is between the finest white syrups and ordinary molasses. There is a large class of consumers who are particularly fond of buckwheat honey, choosing it in preference to the lighter grades. While in most localities these two kinds constitute the larger part of the honey gathered, there are very many classes of flowers yielding honey in various degrees of quality and quantity. While it is true that these different varieties of honey undergo some change in being gathered from the flower, as indicated below, it is also true that they retain their original characteristics, and can easily be identified.

"Is sugar made into honey by the bees?"—Certainly not. The fact that the bees handle sugar-syrup, and place it in the cells, does not make honey of it. If sugar syrup, or molasses, is furnished to them, and they store it in their combs, it will be found to be the same there, just as certainly as the fine linden honey or darker buckwheat are found to possess their peculiar qualities. When the honey is gathered from the flowers it is quite thin. It is so handled by the bees that the moisture is evaporated, and when stored in the cells the air is all excluded, so that it will remain in a liquid state, and not become candied, as it does when exposed to the air. Syrups would likewise undergo a change in these respects.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of room elsewhere.

**We Don't Like It.**—It is impossible to attend many of the fairs, coming crowded as they do, into two or three weeks, and scattered far and wide over the whole country from Maine to California. The last one we were at reminded us too much of a place to sell goods at retail, rather than a display of the wares to please and instruct the visitors, and a healthy striving for the prizes. Mr. Smith was there occupying a permanent place in the machinery hall with a soap to cleanse the skin, and was calling upon every one who passed him to buy and try it. Another man, Jones, the cutler, was there with a full assortment of Jack-knives, and was making it a point to close out his stock at cost. What right has a drygoods or hat store to the space—and much of it in many places—in any building in an Agricultural Fair. We fail to see how it helps agriculture; it is not for the greatest good of the greatest number. Shop keepers we should suggest had better go the rear and let their places be filled with those things which cannot be constantly on exhibition in the street windows of every city, large or small.

### Read the Advertising Columns.

Letters are daily received by the editors, asking where pigs, fowls, seeds, fertilizers, machinery, etc., can be procured. We consider all the information of this kind that is given in the advertising pages sufficient, if those needing anything will only look there; and can not find room to repeat what is already plainly told elsewhere. Every page of the *American Agriculturist*, including the covers, is interesting reading, and should all be carefully examined every month. In addition to looking after what one may want, the reading of what others have to say, in offering their wares, etc., starts up some new idea in the mind of the reader.—When writing to any advertiser, always tell him in what paper his advertisement was seen.

**Show of the N. Y. State Agricultural Society.**—Much of the success of such a show depends upon the weather. The exhibition may be fine, or it may be meagre, to the majority of those who attend it makes little difference; but the attendance really is "the making" of the show. This year two days were unpleasant—showery, and muddy under foot—with slender receipts and a discouraging outlook. The next two days were all that could be desired, and happy thousands crowded the gates all day, and went home tired, and gratified. Thus the show was a grand success, and as an exhibition it was most excellent. There were indeed many fine herds of cattle unrepresented, but the credit of the cattle of the Empire State was well maintained. The striking

feature of the show was perhaps the prominence of the Herefords. We have never before seen so many of this fine race of beef cattle together. Excellent specimens they were too. The large-shouldered kine of Holland made a great show also, as did the trimmest, most compact and beautiful of all neat cattle—the Devons. These last are old favorites which seemed to lose favor a few years ago, but now seem to be gaining again as is meet. Short-horns, Ayrshires, Jerseys, and Guernseys, were well represented, by some of the finest herds in the State, with some from New England. The show of Horses contained an unusual number of heavy draft horses, both of the Clydesdale and Norman breeds. We were not especially impressed with the excellence of either the sheep, pigs, or poultry, though the entries were numerous and the show good. There was a remarkable exhibition of plows. The forms being more or less new and varied. They were furnished with the "skim" instead of the counter, almost without exception, and in other respects the show of implements was of universal interest. The Dairy Department seemed meagre, the Horticultural, good, and on the whole the show was fully up to the high average of the recent exhibitions of this excellent Society.

**"Snobbishness" or "Laziness."**—An item going the rounds, says that a young man in Madison, Wis., bought six collars and a neck-tie, weight under 4 ounces, and through snobbishness or laziness, ordered them sent to his residence; he wouldn't carry a parcel in the street. They were sent in a heavy freight wagon; two men laboriously carried the parcel into the hall, and inquired if it should be left there or carried upstairs. His "affianced" happened to be there, and saw the exhibition. Served him right. . . . A certain lady (?) bought a spool of thread, and ordered it "sent home"—over half a mile. . . . A farmer of our acquaintance, an old subscriber to the *American Agriculturist*, was stopped in the rain by a wealthy man, who haggled about the price of turnips for several minutes, finally getting them down from 33 to 25 cents a bushel, and then ordered a peck; and ended by asking that half of them be yellow turnips for his wife, and half white ones for himself! We saw their delivery, in a immense cart, drawn by 17 yokes of oxen, with a driver for each yoke, each driver carrying and wielding a long whip, and vigorously shouting, "haw, gee, g'long, etc." The oxen's horns were ornamented with white and yellow ribbons, and the white and yellow turnips were marked by ribbons of corresponding color tied around them! The cavalcade made a tour of the town and three wide circuits before successfully backing up squarely to the purchaser's gate. Four men delivered them in a huge basket, and the farmer refused to receive more than 6½ cents, the contract price. A mechanic, previously engaged, was present to chip off the quarter of a cent to make the "change" right. The seller and drivers—neighboring farmers—then went to a hotel, "put out" their teams, and had a bounteous dinner together.

**Did it Hurt Him?**—The above suggests another incident. The writer of this lives some distance in the country, going to the city daily, or as needed by business there, in company with hundreds of others. On the train goes a man reputed to be wealthy and liberal, who almost always has a parcel in hand—some purchase for home, a weekly package of books or papers for his Sunday School, etc. On the same train travels a man whose family dresses extravagantly, and he himself fares sumptuously at the noon lunch; but he is always "short" when a subscription paper goes through the cars for a public or benevolent object. One evening, seeing the first-named gentleman carrying a rather heavy package, he said, "Why don't you send home your parcels by express? I always do; I would not carry them." The simple but withering reply was, "My friend, I have done this for more than twenty years; it does not hurt me any; I have saved not less than \$2,000 thus, and when I want to give one or five dollars to any good object, I find it in my pocket." Did it hurt him? The *American Agriculturist* thinks it did him good. . . . In Philadelphia, in a store one evening, a young man just starting in business, bought a parcel of a few pounds weight, and taking it up, said, "I would like to give some one a shilling to carry this home for me." A gentleman, from whom the young man purchased some of his stock in trade, on credit, stood near, unrecognized, and immediately accepted the offer. Arriving at the house and receiving the shilling, he remarked, "young man, when you want any other such parcel carried, please call on me," handing him his card, which read, "Stephen Girard" (the millionaire). The lesson was a useful one to the business man, and, taken to heart, it made the learner a most successful man in all his after years.

**Plants for Name.**—"W. G.," Warsaw, La. The plants sent belong, as you think, to the order *Scrophulariaceae*. The large flowered one is *Gerardia flava* or Downy False Foxglove. The other belongs to the same genus, and is the Purple *Gerardia*, or *G. purpurea*. We could not tell the species of Sunflower without specimens.

BY SPECIAL REQUEST.

# "20 Days Grace."

## The "Bakers' Dozen."

"Please for once extend your offer to new subscribers for a few days after Election. My neighbors have 'politics on the brain' just now, which is all right and proper for true American citizens at such a time; but this stands in the way of our promoting good farming and home comforts, by efforts to get people to taking and reading your excellent and most useful Journal.—The extra numbers, the 'Baker's Dozen' as you call the 14 month's subscription for the price of 12 months, is one helpful argument with some slow people—those who have not learned the utility and value of reading such a paper...."

Such in effect is the language of one of our friends, and the expressed wish of many others.

The Publishers respond by announcing that the extra offer will be extended a little beyond Election,

### Thus:

**Every New Subscriber for 1881 (Vol. 40) received before November 20, will be Presented with this paper for the last Two Months of 1880.** (We will, for this purpose, keep the plates of this number in printing order until November 19).

### NOTE

**FIRST.**—This Offer extends to all New Subscribers for 1881, including those sent in on Premium Lists.

**SECOND.**—All new subscribers for 1881, arriving between Nov. 20th, and Dec. 5th, will be presented with the paper for December.

**THIRD.**—To put all on a par, those living anywhere too remote to get this paper before Nov. 1st, may have the 20 days beyond the time of receiving THIS number, to collect and forward new subscribers and get the Two extra months.

## Now for the Premiums.

As the election excitement will soon be over, now is the time to push on the making up of lists of names to secure the valuable articles offered in our Premium List. Many can do something at the poll gatherings. The premiums are open to all, everywhere, and any body may get them.

**Over 25,000 Men, Women, and Children** have secured one or more most desirable and useful articles without cost, simply by collecting some names of subscribers for the *American Agriculturist*, and every person they have thus induced to become a reader has been benefited. Anybody else may do the same.

Our friends are doing nobly, already; the premium names received since September 1st, are double last year even, despite the election excitement. There is every indication of coming abundant prosperity for the country generally, and this Journal will do all possible to help promote that prosperity.

**Our plans are very large for greatly advancing the value, beauty, and usefulness of the Fortieth Volume,** and our friends, in soliciting new names as subscribers, and in making up premium lists, may put forth high promises; we will meet them.—Invite every body to get ready for the forthcoming volume by beginning with the last two months of this year, as above offered.

**N.B.** The Fine 44-page Illustrated *Premium List* will be mailed free to any one not having received or preserved a copy, by simply sending a postal card request for it, giving name and P. O. address.

**Fattening Turkeys.**—"J. B. J. P." South Durham, Que., asks, "What do you think is the best and quickest way of fattening turkeys? I mean to fatten up a couple of hundreds this fall for the English market."—Our own experience, on a small scale, indicates cooping closely in open slat coops, well roofed, set up from the ground so that the dung will drop through, and feeding especially corn meal, but changing for a single meal now and then to buckwheat, barley, wheat, etc. Use powdered charcoal occasionally, and follow the plan of soft feed by day and a good feed of hard grain at night.

**Convention of Agricultural Chemists.**—A meeting of Agricultural Chemists was called at Washington, D. C., July 28th, by Hon. J. T. Henderson, Commissioner of Agriculture of Georgia. Upwards of twenty of the leading Agricultural Chemists were present; their attention was principally devoted to the consideration of the best methods of analyzing Commercial Mannres. An adjourned meeting of the Convention was held at Boston, Aug. 27th, in connection with the Association for the Advancement of Science, at which, methods for the determination of Potash, Ammonia, and Phosphoric Acid were provisionally adopted for a year. This movement of the Agricultural Chemists will probably result in the establishment of a sub-section of Agricultural Chemistry in the Association for the Advancement of Science, and a thoroughly organized body of earnest co-workers in the important field of Agricultural Chemistry.

**The Mississippi Valley Horticultural Society.**—Judging from the number that took part in the first exhibition of this new Society, and the wide range of country represented, it would seem that it is a national rather than a sectional institution. Fruit growers and fruit were there from the many States, from New York to California, and the Show was all that the most hopeful could have anticipated. It is a pleasure to record the opening of a new Horticultural Society, with so much promise as this one has of future success.

**The N. Y. Horticultural Society.**—The autumn show of this Society was held on Sept. 22-24th at Metropolitan Concert Hall, and was perhaps the most successful ever held by this Society. Mr. Wm. Bennet won the grand prize for the best 50 stove and greenhouse plants. As usual the Parsons and Sons Co., of the Kisenia Nurseries, Flushing, L. I., took the first prize in Evergreens. John Jones, of Madison, N. J., made a fine display of cut Roses. The show of Ferns was very fine, and the chief prizes were taken by Mr. Henshaw, gardener to Mrs. John C. Green, and Mr. F. Roenbeck, Bayonne, N. J. The prize for Gladioli was awarded to Dr. F. M. Hexamer, New Castle. Mrs. M. J. Morgan made a fine show of Orchids. Messrs. Hallock and Thorpe, of Queens, L. I., exhibited a large collection of Double and Single Pelargoniums, never before exhibited in New York. The best Cut-flower prize was taken by Peter Henderson, of 35 Cortlandt St., N. Y. W. C. Wilson & Co., of N. Y., had a large and characteristically good display of Plants, Flowers, and Floral Designs. Woolson & Co., Passaic, N. J., exhibited a large and choice collection of Hardy Herbaceous Perennials. Among special exhibits the display of Aquatics from Mr. E. D. Sturtevant, Bordentown, N. J., was the most interesting, consisting chiefly of *Nymphaea Devonita*, *N. rubra*, *N. cerulea*, *N. dentata*, and the Egyptian Lilies. Among the

principal prize takers in fruits were J. H. Rickett, Newburgh, N. Y., T. S. Force, also of Newburgh, and C. J. Copley, Staten Island. In the Vegetable Department, Messrs. B. K. Bliss & Sons, 34 Burelay St., N. Y., Wm. Ball, Spuyten Duyvil, and F. G. Hexamer, New Castle, were among the successful competitors. The fruit and vegetables were not as abundant as one would have expected.

**Building an Ice-House.**—This is the season for constructing a house for storing ice. The absence of a plan with full directions, cost, etc., makes this an exception to Nov. numbers of former years. We have nothing new to offer. Those who desire to build, and are not already informed on this important matter, may be glad to know that back numbers containing plans for ice houses, will be sent for 15 cents each. The last plan published—a cheap house to hold about 30 tons—was given in September last. Some of the other numbers, containing fully illustrated articles are: Oct. 1870, Nov. 1871, Oct. 1874, Dec. 1875, Dec. 1877, Nov. 1878, Dec. 1879. The chief rules in constructing the ice boxes are: to have a good non conducting cover to the ice, perfect drainage with air-tight foundations, and ventilated at top. Store the ice in dry, cold weather, and have it packed closely, and the mass as solid as possible.

**Pansies Destroyed by a Grub.**—"R. T. H." Summerside, P. E. I., writes that a small, dark, slate-colored grub, with fine, black stripes on back, and light-colored beneath, about half an inch long, has eaten the leaves of his pansies, and caused the stalks to dry up. Hand-picking and other remedies availed nothing. We suggest "London Purple" as a safe remedy. It should be dissolved in water and applied as for "potato bugs."

**Dead Trees.**—"M. Z." Nazareth, O., writes: "For several years we have been in the habit of sprinkling the grass in our apple orchard with liquid manure, taken from a sink near the manure pile. A few of the trees, now about forty years old, have died. I am told watering with manure is the cause. Is this so?"—No—if it has done the grass good it has certainly not hurt the trees. The difficulty is probably that you have borers in the orchard, and other trees will be attacked. The apple borer may be found beneath the bark at the surface of the ground, and killed by pricking with an awl, or cutting out with the knife, but most successfully fought by making a little mound of ashes or lime around the collars of the trees in the spring, which prevents the beetles laying their eggs there.

**A Western Swindle.**—perhaps not confined to the West—by an adroit use of a scientific instrument, is detailed in our "Humbung Column." It can not fail to interest every reader, either old or young.

**Blight of Fruit Trees.**—Prof. T. J. Burrill, of the Illinois Industrial University, read a paper on "Anthrax of Forest Trees" before the Association for the Advancement of Science, in which he gave the results of some experiments which he had made with pear blight and fire blight of apple trees. He considers them identical in origin, and the result a living organism—a small fungus of the genus *Bacillus*, growing in the living bark. So minute is this fungus that a very high magnifying power of the microscope is necessary to see it. The method of experiment was to cut off small portions of bark of diseased trees, and insert them beneath the bark of healthy ones, as in the process of budding. Sixty-three per cent of all the pear trees inoculated became diseased. Of pear trees receiving virus from blighting apple trees, 73 per cent became affected. When the process was reversed, a much smaller per cent of trees were inoculated. The most conspicuous change Prof. Burrill finds in the tissue of the affected parts is the almost total disappearance of starch from the cells. This would lead one to think that the disease is a fermentation caused by a minute fungus, closely related to those which induce fermentation under ordinary circumstances.

**Colt with Chronic Cough.**—"C. L. T." Poolesville, Md. You should have consulted a good Veterinary Surgeon long ago. There is something seriously wrong when a four-year old colt coughs for two or three years. He probably has some asthmatic difficulty which he will very likely not outgrow.

**Cleaning Oil Barrels.**—"J. S." Harrison Co., O., writes: "Among the numerous plans for cleaning oil barrels, none seem to me to be as effectual as the way I cleaned one two years ago. That was by pouring into the barrel, at the bung, a pailful of strong lye, boiling hot, then rinsing thoroughly, so that the lye reached every part of the inside of the barrel. The barrel was then soaked a couple of days by being filled with clear water, when it was ready for use. I never detected the slightest odor of the oil in the cider or vinegar that has been drawn from this renovated oil barrel."

### Our Editors Abroad.

It is increasingly the custom of the Editors of the *American Agriculturist* to go here, there, and everywhere, and see what is being done, and what is wanted. Just now two of the oldest Editors—those who have given to this Journal their whole heart and soul work for 28 and 18 years respectively, contribute Notes of Observation to this number from widely separated points. One tells us what he has seen in the West and Far Northwest—in a region hitherto little visited; the other in "Notes from the Pines," gives a condensed variety of observations, horticultural and otherwise, from over the sea. The latter is accompanied by another important member of the staff, whose practical work and abundant knowledge will doubtless yet do much towards supplying most useful information to our readers.—With so important a part of the editorial working corps absent, we hope our readers will find in this number evidence that there is a "reserve force" sufficiently strong to get out a fairly good paper, to say the least. It speaks for itself! But all hands will be back at their posts in time to take hold of the first number of Volume 40 with renewed vigor of body and mind, and with new stores of fresh thought; and we are sure the "two-score" Volume will surpass all previous ones in many ways—in beauty, in practical, useful, interesting material for all of its hundreds of thousands of readers.

**Specimen of Muck or Peat.**—"J. J. T.," Pass Christian, Miss. The sample called "muck" is excellent peat—good either for manure or fuel. To prepare it here for manure it would be best to dig it late in autumn or winter, and expose it while wet to freezing, but it is hardly likely that with you it would have frost enough to break up its tenacity. However, when partially dry, peat usually crumbles when roughly handled, and so you may be able to get it fine and dry with ease. When in this condition use it as an ingredient in compost heaps, and as an absorbent of liquids in the stalls, stables, and barn-yard. Composts may be two-thirds to four-fifths muck and the rest manure. Acted on by lime or ashes, with salt, such muck will prove excellent for many crops, and add much to the products of the farm.

**Dam for Ice Pond.**—"P. S. D.," Dean's Corners, N. Y. If you do not strike a gravel bed, the problem you have to solve is an easy one. If you can dam the stream and cause the water to back over a meadow, that is your best plan, for whatever of dirt the stream brings down will not get into the pond very much, but if the bed of the stream must be in the pond, it is still most likely that you will not have much trouble from dirt. The pond need not be over three or four feet deep; but it will probably be best to level it by plowing over the hummocks, and taking them off with a road scoop to fill low spots. The water may stand on all winter and not kill the grass roots, so if the whole is level and seeded to grass, and can be thoroughly drained as soon as the ice crop is harvested, you may depend upon one or two crops of hay besides. The best dam you can have will be a clay dyke. Through the center of this dyke, a row of planks should be set perpendicularly breaking joints, thus  and clay should be rammed hard on each side of them. This prevents leaks, and the burrowing of muskrats. You must provide an overflow—best at the bed of the stream, and a sluice to draw off the water. The top of the overflow must usually be a foot lower than the top of the dam. Make it as narrow as you think it will do, say four to six feet. You will need two, and perhaps four frames (see figure), upon which to spike two-inch planks crossways—making the joints as tight as possible, battening them with fence strips if necessary. Planks are nailed across the sides of these frames against the dyke on each side, and clay is well rammed against and around them. The lower part of this plank part of the

AN OVERFLOW DAM OF POND.

dam must also be well clayed, and if the clay is very stiff it will be necessary to dash a little water on it to soften it during the operation of ramming.

### Sundry Humbugs.

In sending on the adroit swindle noted below, Mr. Judd writes: "Follow up the humbugs with an unsparring hand. I hear on every side, in the Far West especially, constant testimonials to the great work the *American Agriculturist* has accomplished in the persistent exposure of humbugs during all the past quarter century. Those of the cheating fraternity who work mainly through the mails, generally hide themselves in the depths of some densely populated city; operate chiefly at distant points—so far off that their victims will not be likely to ferret them out and obtain legal redress. But the Western country abounds in travelling 'agents' for this, that, and the other bogus implement, patent, device, recipe, etc., etc. The press, so long silent, is latterly coming to the aid of our Journal, by copying our articles, and partly by original investigations and exposures. This is well. If they will keep it up, and unitedly shut out advertisements of Lotteries and other swindling schemes, it will be worth millions to the country. I have been told scores of times this summer by our western subscribers, that the *American Agriculturist* would have paid its readers many times its cost, if, leaving out all the rest, it had only printed its Humbug Columns and its advertising pages—the latter as one of the few sources of information, where one may find what he needs, with the confidence that he will not be cheated by the advertisers."

#### JOURNALS ADVERTISING LOTTERIES INDICTED.

If the newspapers would not advertise the "drawings," and the false stories about "great prizes" secured by little outlay, often told as news items, the lottery business would soon come to an end, especially now that the Post Office Department is as far as possible closing the mails against the managers of these swindling

concerns, for such they ALL are in effect, if not ostensibly so. The best managed, if there can be any best, do not give the ticket buyers anything like an equitable chance; while as a whole the so-called State and other lotteries are merely organized cheating establishments. During the past month a considerable number of prominent journals of New York City have been indicted by the Grand Jury, and their right to trample upon, or defy the legal enactments of the State is likely to be tested. That they feel and fear, is shown by the present absence from their pages of the array of long columns of "prizes," "Capital," "Grand," and otherwise, said to have been secured, or that are to be secured.

#### An Adroit Scientific Swindler.

While travelling at the West, we learn from a friend of one of the victims, the particulars of a novel, or, at least an adroit swindle practised in Illinois and Iowa, and probably elsewhere. There is a little philosophical apparatus, long in use, called a "Pulse Glass," to illustrate the effects of slight differences in temperature. It consists of two glass bulbs, (A, B, fig. 1) of very thin glass, of any size from half an inch to three inches in diameter. These are joined together by a tube of thicker glass, anywhere from 3 inches to 15 inches in length. In

making them the air is expelled by ether vapor, and the bulbs are partially filled with liquid ether, colored scarlet or red. If the hand is applied to A, its heat expands the ether vapor above and rapidly pushes the liquid ether into the bulb B, as in figure 2. Shifting the hand from A to B will quickly drive the liquid back to A again,

Fig. 5.

Fig. 6.

as in figure 3, and the operation may be repeated as long as one wishes. If A be taken in one hand, and B in the other, as in figure 4, and both hands are equally warm, there will be no motion of the liquid. If two persons each take one of the bulbs in the hand, the warmer hand will drive the liquid into the other bulb. If, as in fig. 5, a person takes hold of one tube, with the thumb and finger, the inside of the hand not touching the bulb, though held over it as a blind, and places the other bulb against the face, or any part of the warm flesh, the liquid will be driven into the bulb under the hand. But by grasping the other bulb closely in the hand, the liquid will be driven back, as in figure 6. In brief, any slightest degree of higher heat upon one bulb, will drive the liquid into the other. Simply blowing warm breath or cold air upon either bulb will cause a movement of the liquid.

#### HOW USED BY THE SWINDLER.

A man, of good address, driving a fine team, calls upon a well-to-do farmer, nominally to inquire the way. He speaks of the beauty of the country, etc., and continues the conversation on various topics, managing to intimate that he is Prof. B—, in the College of Physicians and Surgeons, in New York, or in some other well-known Medical University. He also himself assumes the name of some distinguished Professor in the College, and says he is out on a vacation or visit, driving for his health, and on his way to some town at a considerable distance. The result is that he gets an invitation to stop for the night, which, after sundry protestations he accepts. His horses are well cared for, he is assigned to the "spare room," and generously entertained as

#### "AN ANGEL UNAWARES."

He makes himself very agreeable during the evening, has much information to give, and all are delighted at having so distinguished a guest. Of course, he will not be allowed to pay for his keeping—the offer of remuneration is almost an insult. So, on departing, he is profuse in his admiration and thanks for Western hospitality, and in return feels obliged to do a little favor. So he calls his host aside, and intimates to him, in the most delicate way, that his great skill has enabled him to discern that the wife, or a favorite daughter, is threatened with approaching epileptic "fits," or even "insanity," or other brain disease, and advises him to call early upon his

#### "FAMILY PHYSICIAN."

The host is alarmed, and earnestly asks if it can be so. Here comes in the "pulse glass" which the "Professor" brings out from his pocket-case of instruments. He applies the liquid bulb to the region of the jugular vein (fig. 5), and the liquid darts over to the other bulb, simply from the heat of the neck. He applies it to another person's neck, and no such effect takes place, because he then carefully keeps his warm hand upon the other tube, as in fig. 6. Repeated trials on different persons invariably produce the same result; the "diseased" wife or daughter only sets the red liquid in rapid motion because in her case only is the opposite bulb left unwarmed. Of course the unscientific host, not observing the sleight of hand, is fully convinced, and becomes greatly anxious. He is still referred to the "Family Physician," as the accomplished guest "determined, on leaving home, to

give no attention to his medical practice, for his own health's sake, and had only incidentally referred to the case before them in a thoughtless moment, overcome by the kindness of his host." His host is thoroughly aroused, "fears the family physician may not understand the case," and beseechingly implores his wondrously skilled guest to "do something for them." After many objections on his part and much earnest entreaty, he finally lets it out that he is going to visit a dear friend who has a member of his family similarly affected, and that he, leaving the College he had prepared a single bottle of medicine that was considered the only sure remedy. He is implored to let his host have it, but he protests that it was difficult to make up, that his friend was waiting for it and he had perhaps done wrong in delaying for the night; that he could only get another bottle by telegraphing and calling an expert from a distance to make it up; that he was to have \$50 for it, and that it would cost almost that to get it made by telegraph and forwarded with extra dispatch by rapid express, or by special messenger perhaps.

#### RESULT.

The host gladly pays the \$50, or perhaps \$100; the Professor drives off rapidly to reach the nearest telegraph office—(rather to find another victim a few miles off) the inert medicine is used and speedy cure obtained, because there was no disease; the family are wonderfully grateful and Providence is often thanked for directing the angel unawares to their door. Of course no one reveals to others the fact that a member of the family has been so near the verge of epileptic "fits" or "insanity"; and the swindler goes on unexposed and unmolested, finding other victims. If successful once a day, it yields him \$25 to \$100, which is nearly clear profit as his "home, hills" are next to nothing. This is a veritable case. We here give it in full, to help put our readers on their guard, not only against this particular imposter, but against a variety of other "angel's visits unawares."

#### NURSERY AND TREE AGENTS.

"S. T. R., of Cal. (and many others). Mr. R. asks, 1st, 'if Ellwanger & Barry, of Rochester, N. Y., are reliable?'—They are entirely so, or their advertisement would not be found in the *American Agriculturist*; and 2nd, Mr. R. asks: "If I buy of ——— who claims to be E. & B's. agent, will I get what I pay for."—Or that we know nothing. There are agents and agents, everywhere almost—some good, and reliable; many others are the veriest swindlers of the meanest kind. To sell a man a tree over which he is to devote years of time and care before he can know that he is imposed upon is worse than stealing his money directly from his pocket. The best way to do is to send always direct to the nurseries themselves. If disposed to listen to the agent, get his terms, etc., but *never give the order to him in any case*; send the list directly to the proprietor, if well known as a reputable party, and ask him all about it the terms and quality, etc., and if satisfied send the order directly to him. The "agent," if an authorized one, will settle his commission on sales with his employers.

'PROF. CALDWELL'S MAGNETO-GALVANIC BATTERY,' which he asks Postmasters to become agents for, was shown up and pictured in our last May number, page 177. Then it was "Prof. Boyd's," but had no "heart" in the middle. It is just now most extensively pushed all over the country. The claims for it are non-scientific, and the sheepest nonsense. We would not give five cents a bushel for them, except as old metal.

#### MISCELLANEOUS.

Don't buy, or touch, or become agent for any of the mixtures and preparations offered as cheaper than kerosene, for producing light, no matter how tempting the offers of profits, or of patent lever watches to agents. All these mixtures are positively dangerous, however "safe" the burners are claimed to be. More such offers go out from Michigan than elsewhere. . . . Subscribing for before unhard of new papers and magazines is risky, if issued by parties one has never heard of. Of course there are worthy new enterprises, but there are every year numerous such sheets started with tremendous inducements to subscribers and agents, which are frauds, or are issued by enthusiasts, or by parties with no capital; and after one, two, or three numbers go out, cease to live, and those subscribing lose the money paid in. Often there is lack of honesty or lack of money to pay postage on answers of explanation to inquiring and complaining subscribers. Complaints of such treatment are among the commonest contents of our humble drawer. . . . "W. J. K., of Mo., and many others sending medical circulars and inquiries, are respectfully referred to the full showing up of all sorts of Patent Medicines, on page 300 of the *American Agriculturist*, for August 1880. . . . "The U. S. Washing Machine" was pictured and its sellers exposed on page 133 of April *American Agriculturist*, to which our Lady Subscriber in California and many other inquirers among new comers, are referred. . . . To inquiring new readers: Rev Joseph T. Inman, Bible House, N. Y., an extensive advertiser, is a humbug of the first water, often exhibited in these columns.

**Liquid Manure.**—"A Subscriber," Millheim, Pa., writes: "Please let me know whether it would profit a farmer to apply Liquid Manure to land, and the quantity to the acre."—Liquid Manure is the "double-distilled extract of fertility"—distilled, so to speak, in the animal economy. There is not a plant on the farm which will not be grateful for it, but it must not be too strong. Whether you can apply it with profit, is another question. Probably you could with proper appliances, especially a good sprinkling cart. The quantity to be applied to the acre is hard to measure. Experience will indicate the strength desirable, and it will be found most beneficial upon grass and grain crops, frequently applied while they can be gone upon without detriment.

**Peach Yellows.**—"J. S.," Harrison Co., Ohio, writes: "My peach orchard has all become affected with the disease termed 'Yellows,' and most of the trees died from it. Would it be safe for me to replant the same orchard immediately, after grubbing out and burning the old trees? Or in other words will the young trees take the disease by their roots coming in contact with those of the old trees?"—It is proved beyond a doubt that the "Yellows" is contagious, and whatever the exact nature of it may be, it is not safe to plant a new orchard upon the same ground where the "Yellows" has prevailed to a destructive extent—not immediately at least.

**Removing a Beam for Horse Fork.**—The old barns, which had more and much larger beams than were necessary, had to be changed somewhat inside for the working of the horse hay forks. The method of removing the upper or "little beam" and supplying

REMOVING UPPER BEAM FOR HORSE FORK.

its place with braces is shown by dotted lines in the accompanying engraving. With this beam removed the hay fork, with its load, has free working room, and at the same time the roof is as thoroughly braced as before.

**New Jersey Exhibition at Waverly.**—The especially noteworthy portion of the show this year was the exhibition of fruit. It was almost altogether that of amateur fruit-growers, and the specimens were superb. There was only one exhibit by a professional nurseryman. Mr. Quinn, the officer of the Society in charge of the Horticultural Exhibition, said it was the best show of the kind he ever saw, and we are quite ready to believe him. In other respects the show was about as usual. A new feature has recently been added. The Sanitary Department, in which apparatus for house-plumbing, drainage, city sewerage, disinfectants, etc., were exhibited. In connection with this, but not of it, the State Experiment Station displayed a large number of samples of commercial fertilizers sold in the State during the year. These had been carefully analyzed, and the analysis was given, together with the estimated value, as shown by the analysis, and this compared with the price at which it was sold. This "estimated value" is really no guess work, but the real value of the ingredients at prevalent market prices. It would be better, perhaps, to call it "Deduced value," as showing that the value is taken directly from the analysis in each case. In this connection we may allude to the article of *baled horse manure*, put up by a company in Newark for shipping into the country. This indicates real progress in handling the article. The bales are compact and inodorous.

**"Worm" on "Pussley."**—"C. T. S." sends a "worm" which he found feeding upon the common garden pest, the purslain or "pussley." The "worm" did not arrive in the best condition; it is the larva of some insect which we do not recognize. We rejoice with Mr. C. that there is an insect enemy to the "pussley," and only hope his tribe may increase, if it will only eat out this rapid growing pest of the garden. It may be encouraging to many gardeners to know that there is a white mould making a vigorous growth of late years upon this same plant, that may help to keep it in check.

(Basket Items continued on page 455.)

## Editorial Items from the West.

### New Texas Cattle Routes.

At Prairie du Chien, on the Upper Mississippi, we noticed extensive cattle yards in course of construction, and, on inquiry, learned that they are intended as resting and feeding yards for cattle brought by railway 400 miles, from Running Water where they cross the Missouri River near the mouth of the Niobrara. Open a map and follow the cattle as they start from Texas over the long route, up to Nebraska and Southern Dakota, feeding and growing as they go, 10 to 15 miles a day. Pastured in Nebraska and Southern Dakota, and sometimes finished off on corn in Nebraska, they are gathered at Niobrara, and started on a railway journey of 674 miles to Chicago—but profit and safety, as well as a humane legal provision, require them to be unloaded for rest and feeding at this point. If destined for Eastern markets, a thousand miles more of railway carries them from Chicago to New York. The map will show four other railway routes running across Iowa from east to west, and two across Minnesota, all extending to Chicago, and all will take part in gathering and transporting these vast herds of cattle, both those originally from Texas, and those fed or raised in Western Nebraska, Dakota, and Wyoming. It will be seen also that half a dozen other railways cross the State of Missouri, extending westward and southwest to the vast plains south of Nebraska, etc.

### Cattle from Montana for the East.

Away up the Missouri River, 200 miles above the mouth of the Yellowstone River, we saw a single herd of over 1,000 cattle being slowly driven down the north bank from Western Montana to Bismarck, where (nearly 2,000 miles from New York), they will be shipped over the Northern Pacific R. R., and on eastward via St. Paul and Chicago. We also saw other large lots coming down by boats, a thousand miles or more from Fort Benton and westward, to Bismarck. All accounts agree that there is to be an immense business done in stock raising—cattle, horses, etc.—in Western Montana, now that new outlets to Eastern markets are opening. The extent and possibilities of our country can be but faintly appreciated until one has gone over at least a portion of the "Great West"—including that part west of the middle Missouri River.

### Flax on Prairies—Mills Wanted.

As we have before noted, many farmers at the west find it profitable to put in flax as a first crop on newly broken prairie. [See September *American Agriculturist*, page 340.] It requires little work, and yields 8 to 12, or more bushels. We found in Central Iowa a number of farmers who raise a good deal of flax on older land, the yield being 12 to 20 bushels of seed per acre. Oil mills will make a home market for the seed, and the more oil-cake there can be sent east, the better it will be for the older farms. Query: Will it not pay enterprising men to start more establishments for using the straw or fibre which is now mainly wasted? It strikes us that here is a good field for occupancy—perhaps for new inventions in the way of working and using the machine-thrashed straw or fibre. There are now, here and there, manufactory which buy this straw at \$2 to \$4 a ton—that which has been run through the ordinary thrashing machine.

### Quick-Growing Trees.

We have seen many vigorous groves, wind-brakes, and fences, in several parts of Iowa, of the quick-growing Soft Maple, Willow, Lombardy Poplar, and Cottonwood. The Maple is raised from seed; the other three from cuttings. Slips six to eight inches long are stuck into the new-broken ground, and grow so rapidly that in the course of four years they give an abundant supply of wood, and, when placed in line, a good fence is left after cutting the upper part off for fuel. We found farmers almost equally divided in their preference for Maple, Poplar, Cottonwood, or Willows. In Benton County, Iowa, there are flourishing Osage Orange Hedges, but north of this the plant is considered uncertain as a general rule—not always.

## Some Improved Windmills, or Wind-Engines.

In the March number of the *American Agriculturist*, pages 98-99, we discussed the value of the force of the wind as utilized by the Windmill or Wind-

Fig. 1.—THE "HALLADAY" MILL AT REST.

engine. At the same time a number of standard mills were presented, and their differences to some extent pointed out. These did not include all the first-class mills; in fact, we did not even mention the "Halladay" Mill, made by the U. S. Wind Engine and Pump Co., Batavia, Ill., one of the pioneers, as many of our readers know, in the field of improved Windmills in this country. In the present article, without setting forth the importance of windmills in general—as that was given at some length last March—we simply wish to add to the list then commenced, some of the mills that have since come before our notice. The main feature in the "Halladay" Windmill is the arrangement of the regulating gear by a sliding head, so that when the velocity increases the sails present less surface to the wind. The speed of the wind-wheel is dependent on the velocity of the wind, and the angle at which it strikes the sails. In the "Halladay" the exposed surface is diminished without changing the angle, thus keeping the pressure of the wind equally distributed on all sides of the wind-wheel, avoiding strain, and at the same time time being self-regulating.

Figure 1 shows this mill in position when at rest. When the sails are fully spread they take a radial position somewhat as in the wind-wheel shown in figure 2—that of the Eureka Mill, manufactured by the Kewanee Mfg. Co., New York City. This is a "solid wheel" mill, and, like all of its class, has certain points in its favor. It is claimed that ice and sleet do not interfere with their work as much as with the movable mills, which sometimes must be cleaned before they will start. It is a self-regulating mill, and simple in its construction.

The "Champion" Wind-engine is shown in figure 3. The same company, Powell & Douglas, Waukegan, Ill., make an Iron Screw Windmill; it has

Fig. 2.—THE "EUREKA" WINDMILL.

a twisted sail, and works on the same principle as a propeller wheel, in fact, is the "Champion," with corrugated iron instead of wooden slat fans. These

mills are self-regulating, and can be set by the governing weight to run at any desired speed. An all iron mill is shown in figure 4—the "Iron Duke," made by O. S. Gilbert & Co., Indianapolis, Ind. This is a self-regulating mill, and, for the power it gives, is light, strong, and durable. Each of the mills mentioned has special points of its own, which are set forth at length in the circulars and pamphlets of the several companies, and with the light which these will give upon the subject, those desiring mills are enabled to decide which meets their wants the most fully. The U. S. Windmill Co., for example, makes 17 sizes, ranging all the way from that of one-man power, up to those of 45 horse-power, employed by railroads, etc.

## Tim Bunker on Going to the Cities.

MR. EDITOR.—Your call for more "copy" comes right in the pinch of fall harvest, when apples are to be picked, corn to be cut up, pumpkin and squashes gathered, rye to be got in, mangels to be housed, and a dozen other things to be done before Saturday night. This crowding a man, when he is already in a tight spot, is not always convenient. Just now the topic of discussion in Hookertown is the emigration of our farmers to the cities and villages. It has been up in the Farmer's Club, the women have talked it over in the Sewing Society,

Fig. 3.—THE "CHAMPION" WIND ENGINE.

and Mr. Spooner has preached a sermon for the times in which, Seth Twiggs says, he gave "the oneasy critters that are itching for city life, fits." It is the town talk, any way, and every body here wants to know what you are going to do about it.

You see, when the "Shadtown Herald" came out with the census statistics of this Commonwealth, it came upon us like a thunderbolt, that the farms had lost over 12,000 people, and the cities and villages had gained 88,000 in the last ten years. There were the figures in black and white, put down over against every town in the State, and there was no getting away from the ugly facts. A meeting of the Farmer's Club was called right off, and the assembled wisdom of Hookertown freed its mind. Deacon Smith said he felt a good deal discouraged at the result, he said he had been hoping that the agricultural fairs, which are held now in every county in the State, the Farmers' Clubs, which are numerous, and the greatly increased circulation of agricultural papers would stop this depopulation of the rural districts, and turn the tide in their favor; but it has not been done. The show was worse for the farms than in any previous census, and he hardly knew what to make of it.

Jake Frink said, "the Deacon need not trouble himself to make anything out. It was already made, and we might as well look the thing in the face. I've thought on't considerable, and guess I see thro' it. Laziness is at the bottom on't you

may depend. My Kier has gone off to the city, and all his folks. Ye see he got tired o' raisin corn and potatoes on the old farm and married the widder, and was off to the Whiteoaks, 'cause he thought it was easier to swap horses, and burn charcoal, than to stay at home, and airn his bread by the sweat of his brow. It warn't long before he got tuckered out with carting coal, and moved into Shadtown, and opened an oyster saloon. The business hain't never paid and never will. Fact is, laziness don't pay anywhere that I know of. We may change the place, but we don't git rid of the pain by gwine off into the city."

Seth Twiggs emptied the ashes from his second pipe, and said, he was glad to hear so much good sense from his neighbor Frink. "But I rather think, judging from the looks of some farms in this neighborhood, there is considerable laziness that has not emigrated. He guessed the young men had been lectured too much on the use of tobacco and on the sin of raisin it. It was one of the few payin crops, and when the ministers and the deacons, and the moral reformers came out agin it, as a crying evil, he did not wonder that some of them shut up their tobacco harns, and started for the city, where they don't trouble themselves about a man's morals, if he only paid his taxes and pew rent. For his part he had always smoked ever since he was a boy, and tho' it was a nasty and expensive habit, he thought some other things were worse. I've suffered a good deal of persecution for it, and some times thought I should emigrate if folks did n't let me alone. My wife hetchels me by night; the hoys hail me in the street as a walking coalpit. Tim Bunker always puts a pipe in my mouth when he writes, and Mr. Spooner preaches about 'fleshy lusts warring against the soul,' by which he means me, and he might jest as well call out my name in meetin. I guess I shall have to go to the city myself, where they can smoke in the streets, and in the cars, and nobody make a fuss about it. Fact is, Hookertown is gettin too narrer."

"Jess so," said Geo. Washington Tucker, "It's narrer than the edge of a knife. A feller can't drink a glass of lager or a little whiskey, but what a smellin committee is around after him, made up of deacons and Dorcas Society women, who want to know where he got his likker, and use him as a witness against the poor man who is trying to get an honest living, by selling a little harmless heer. Talk about Hookertown's being narrer, is n't the State narrer? Did n't the legislator last session pass a law defining lager and other malt liquors as intoxicating drinks! Ye see folks won't stand sumptuary laws, and they are getting out of it. I'd go myself to-day, if I had anything to go with."

Mr. Spooner, who talks about as well on agriculture, as he does on religion, took a more cheerful view of the situation. He said "the fact of a decrease of the population in the farming districts was not to be disputed. It was not peculiar to Connecticut, but was true of all the older States, as far west as Ohio. The population of the farms

Fig. 4.—THE "IRON DUKE" WIND ENGINE.

were not all drawn to the cities, but to the virgin soils of the West and to the sea. Morals and legislation upon questions of morals he thought, had little, or nothing, to do with it. Our agricul-

ture was in a transition state, from the old style farming of fifty years ago, to the new ideas of the present generation. A great deal of new light has broken in upon the art of cultivating the soil, and farmers are studying, and learning, the science of their business. Some are apt scholars, and know what tools, manures, and stock are needed to make the particular farm they cultivate, pay. These men have no thought of going to the city, or going West. Their skill and labor are as well rewarded here as they would be at any place. They are fairly prosperous and enjoy life. Others are slow in learning, cling to the old methods, raise crops in competition with the new lands of the West, and get discouraged, and go into other business. Better times will come a while hence, when we get over the transition state, and understand better what crops will pay, and learn how to live well upon the limited income upon the farm."

These remarks of my neighbors show the drift of public opinion upon the great change that has come over our farming towns. The tide of population is away from the farm, in every agricultural parish in the State. Seventy-five of our rural towns, show a loss of twelve thousand in ten years. This is by no means an unmixed evil. It does not prove a decline in wealth, or in morals. If a farmer who understands his business, huys up the land of his thrifless neighbor who is doing a losing business, the Commonwealth gains rather than loses. The acres, that did not pay under poor husbandry, will be made profitable under good, and add to the food supply of the State. An increasing, thrifty city and village population means a larger number of consumers, and better prices for the milk, butter, veal, lambs, pigs, poultry, eggs, and vegetables, and fruits, raised upon the neighboring farms. The man who loses money in farming, for want of skill, may sell his labor at a profit in the city or village, and be a gainer by the change. With this fact of a declining population in the agricultural towns we have another, that farms in this State have appreciated in value, averaging seven per cent. Let us give thanks and take courage.

Hookertown, Ct., } Yours to command,  
Oct. 10, 1880. } TIMOTHY BUNKER, Esq.

### Notes from the Pines.

When I wrote my last "Notes from the Pines," little did I suppose that the next "Notes" would be from among the "Pines" on the other side of the Atlantic. Here the most frequent Pines are usually called the Scotch Fir, though it is not a Fir at all. I do not propose to give, in these "Notes," an account of travel, which would be quite out of place, but merely note some horticultural matters that strike an American as different from those he is accustomed to in his own country. A brief sketch of

#### The Route Travelled

will indicate the localities referred to. After landing at Queenstown and reaching Cork, we went to the famed Lakes of Killarney, by way of Bantry and Glengarriff. Our route took us through one of the wildest parts of Ireland. Through North Wales to Chester, to Liverpool, and thence to the venerable University town of Oxford, where these Notes are dated. Glengarriff is almost at the extreme south-eastern part of Ireland, on the Bay of Bantry and a popular watering place. Here we found

#### Fuchsias in Hedges.

In front of the hotel was a long hedge of what I took to be *Fuchsia coccinea*, one part of which was fully 8 feet high, the principal portion being kept at about 3 feet. This, with its myriads of pendulous, bright scarlet flowers, was a horticultural exhibition of itself. The Blue Passion-flower ran in among the Ivy which covered the front of the hotel, and displayed its flowers against the dark-green back-ground with fine effect. All through the mountains, from Glengarriff to Killarney, the country was bright with

#### Furze and Heather,

both of which were in full bloom, the bright yellow of the Furze contrasting finely with the rose-purple tints of at least two species of Heath. The Furze or Whin (*Ulex Europæus*), is much used for fencing

all through this portion of Ireland. A low ridge of earth is thrown up, or a wall of turf (sods) is built, and Furze planted upon the top. This plant is a mass of thorns, and soon forms a complete barrier. It has its disadvantages, however, for, like all live fences, if neglected for a few years it becomes a shapeless and unsightly mass. Besides this, it is apt to become a weed, and spreading, probably by seed, establishes itself in the fields and, if not eradicated while young, will soon take possession. I noticed several pastures rendered useless from this cause. What a country this is for

#### Broad-Leaved Evergreens!

Of course the Holly and Ivy are to be seen everywhere, the Ivy just coming into bloom, while the Bay Laurel, Cherry Laurel, and a host of others that must be kept under glass at home, are here among the common out-of-door shrubs.

In front of our window at Killarney was a specimen of *Aurucaria intricatus*, the "Monkey Puzzle," at least 20 feet high, and of the most perfect form, not a single one of its branches missing to mar the formal arrangement. The American is frequently and unfavorably struck by the

#### Paucity of Vegetables

in this country. Cabbages and Potatoes are served everywhere; besides these, Cauliflowers, String Beans, Scarlet Runners, and Vegetable Marrow, are all that I have thus far met with at the best or the poorest hotels. The Scarlet Runner, which we cultivate sometimes as an ornamental vine, is here common in gardens, but it is a sad substitute for our delicious Limas. Vegetable Marrow, rarely seen with us, is a long white squash; it has very little character of its own, but is an excellent medium for butter or white sauce. I have eaten overgrown cucumbers dressed in the same manner, and think them quite as good. This country seems to be the home of all forms and varieties of the Cabbage; Kales, Cauliflower, Brussels Sprouts, Collards, besides the heading forms, are abundant in many gardens, and in the moist climate reach a perfection not known with us. Indeed, common Cabbage is so tender and marrow-like, that though it was served as Cabbage, it was so different from the same thing at home that, supposing some mistake had been made, I inquired and learned that it was merely "common Cabbage."... One thing that struck me particularly, is the almost entire

#### Absence of Orchards.

In the long journey from Cork to Dublin and Liverpool, and thence to this place, within about 50 miles of London, I do not think more than a hundred or two apple trees were seen, and these in such small clumps that they could hardly be called orchards. Upon inquiry as to this absence of orchards, the reason assigned was, that the land was rented, and the tenants did not care to plant trees upon land which they might be obliged to give up at any time. This must be a very poor apple year, as in the above-named cities I saw in the fruit stores and on the street the most wretched fruit, gnarled, specked, and so poor that our farmers would reject them even for cider-making. In the abundance of our own crop it is probable that a much larger amount will be shipped than ever before. Plums seem to be the most abundant fruit, and often very good; have seen no very fine pears, but it is probably early as yet. Grapes, though mainly raised under glass, are much cheaper than "hot-house grapes" are with us. Women in several cases brought them to the car windows, offering bunches at a shilling each (24 cents), which would cost 50 to 75 cents at the Broadway fruit stores. . . One often sees a small or sometimes a large patch of

#### Osiers, or Basket Willows,

and baskets that are evidently home-made are very common. The great variety of baskets and hampers is very interesting; there are large and small hampers, round, oval, and square hampers, some are shallow and others deep; hampers with covers and without. Hampers for lunches, for game, and all sorts of produce, up to enormous things too heavy, when empty, for one man to lift. All these are not home-made, though a large share is produced by the farmers or gardeners. Whether this is an example that might be profitably followed by

us, I much doubt. The time required by an expert workman must be so great, that with us a hamper would be a costly affair. Besides this, basket-making is a "puttering" work, and of a kind that our people do not take to kindly. A boy with two or three pieces, as may be, of board, and some laths or slats, will knock together in a few minutes a crate which will answer every purpose of a hamper that must require some hours to make.

#### The Oxford Botanical Garden

is not very large, but under the direction of Prof. M. A. Lawson, is in excellent keeping. It is interesting on account of its antiquity; and what, in this interesting town, is not old?—even the hotel where I write was built before Capt. C. Columbus took that memorable voyage! This is the oldest Botanical Garden in England, if not the oldest in existence. It was completed in 1633, it being founded by the Earl of Danby for "the improvement of the faculty of medicine." Its gateway, containing statues of the 1st and 2d Charles, was designed by the celebrated Inigo Jones, and was paid for from a fine which one Anthony Wood had to pay for indulging in a libel upon the Earl of Clarendon. It was pleasant to meet with many of our familiar American plants, conspicuous among which was our Poke or Pigeon-berry. Another home plant was our Cardinal Flower (*Lobelia cardinalis*), the flowers of which were much larger than at home, but not of such an intense scarlet.

Those who read of Oxford as a University town, have little idea of what the term expresses. It has

#### Over Thirty Colleges and Halls,

each of which, with its chapel, quadrangles, etc., is larger than any American College, Harvard and Yale, perhaps, excepted, and dating from the first century all the way down, there being but two or three that are not over 300 years old. One could devote weeks to the place, and then not see all of interest it contains. Having only parts of two days here, but a few out of the many Colleges could be glanced at; the matter of interest about these, that can be properly mentioned here, are but few. One of the noted points is "Addison's Walk," in the grounds of Magdalen College. This name, by the way, I did not at first understand, when given the local pronunciation, which is as if it were spelled *mandlin*; it is so called by those belonging to the College, as well as by the towns-people. The "Walk" is a well shaded avenue, with very irregularly planted trees, and with its abundant underbrush has a rather neglected appearance. The fact that it was the favorite resort of the author of the "Spectator" has given it a celebrity which would not otherwise attach to it. For me the most interesting thing about the walk was the view it allowed of a large herd of deer which were inclosed near by. While the walls of most of these old structures are abundantly clothed with Ivy, one is often reminded of home by coming upon the

#### Virginia and Trumpet Creepers,

the one putting on autumn tints which but poorly represent the beauty of the vine in its own country; the other is still showing a profusion of its scarlet blooms, which appear to be brightened in brilliancy as they are seen against the dark green of the Ivy. In the quadrangles there is generally a square of well-kept grass, looking as turf only can in this favorable climate; its brightness and freshness seeming to be out of place when surrounded on all sides by tall time-stained and crumbling buildings. If any attempts have been made at ornamental planting in these courts, we did not fall upon them.

**Enriching Poor Lands.**—There are three principal methods of rapidly increasing the supply of plant food in any soil: By feeding concentrated foods upon the land, as oil cake, cotton-seed cake, etc.; by the application of barn-yard manure, and the use of artificial fertilizers. Which of these three methods is to be adopted in any given case must be determined by the many conditions and circumstances that surround it. It may be that the feeding of sheep with decorticated cotton-seed cake upon a poor pasture may be the quickest and best method of enriching the land. In other cases the purchase and application of barn-yard manure may

be the most profitable. When it comes to the artificial fertilizers, it should be borne in mind that their true office is to supply quickly one or two ingredients that may be deficient in the soil—when these are known their use is to be recommended.

### Editorial Correspondence.

#### Up the Missouri.

Having made many tours of agricultural study and observation during the last thirty years—often through and through such States as Ohio, Indiana, Illinois, Iowa, Michigan, Wisconsin, Minnesota, and frequently through nearly every other State—we thought we knew the whole country between Canada and the Gulf of Mexico, the Atlantic Ocean and the Rocky Mountains. But not quite so. We had not been up the Missouri River, over 2,500 miles above its entrance into the Mississippi at St. Louis. In our notes for the August *American Agriculturist* it was intimated that an American was not sufficiently educated to go to Europe until he had journeyed a thousand miles west from Chicago, and two or three hundred miles down through Colorado, taking in the mining regions; and then 750 to 1,000 miles northwest from Chicago, and down the Great Lakes. Now we add: Nor until he has been up the Missouri River 2,800 miles to Fort Benton, and also at least 200 or 300 miles up the Yellowstone. These trips can be safely and comfortably made at moderate expense, especially in June and July. Steamers run from Sioux City to Fort Benton (over 1,500 miles) and carry passengers the round trip for \$75 to \$85, or for \$50 one way, board included. Sioux City is easily reached by 550 miles of railroad from Chicago. In a year or two a journey to and through the wonderful Yellowstone Park, will be an easy pleasure trip. Exploring the Park portion is as yet rather tedious and expensive. A railroad already extends hundreds of miles north of Ogden in Utah. The Northern Pacific Railroad is built west of Bismarck almost to the Yellowstone, and will reach it the coming winter, or early in the spring, and push on up its valley. So there will soon be a great circuit tour, out over the Union Pacific to Ogden, northward to the Northern Pacific Railroad, and back through the Yellowstone Valley, through the great wheat region east of Bismarck, the Red River Valley, and on down through Minnesota and Wisconsin to Chicago, or via Duluth and the Great Lakes to Buffalo. But one need not wait for that even, to take a trip up the Missouri from Bismarck, or even from Sioux City. Bismarck is 557 miles from Chicago, via St. Paul, and some 750 miles above Sioux City by river. If saving time is an object, one can take the river at Bismarck. If time allows, the river route up from Sioux City to Bismarck—occupying anywhere from 10 to 15 days going up, much less going down—may well be taken to see the country and scenery. The usual single railway fare from Chicago to Bismarck is \$33; time, two days and nights.

#### Travelling on the Missouri River,

will be a novelty to Eastern people. The stream for 2,300 miles from its mouth to the Yellowstone, is usually very broad, with shallow water. Sometimes it contracts to a fourth of a mile in width, and at others spreads out a mile or more. The bed abounds in bars of quick-sand, partly above and partly below the surface. See figs. 3 and 4. The navigable channel is seldom over ten feet deep, often only two to three feet deep, and usually but a few rods wide, that is between the June and July rise and the freezing up in autumn. The melting snows from the mountains greatly enlarge the stream in depth and width during early summer, and navigation is not difficult. But the channel is very change-

able, so much so that a steamer often runs upon a sand-bar in the very place where it went through deep water on its previous passage. At this season (last of August) we have only averaged 65 miles a day, in coming up, and have been fast on sand-bars a dozen times a day, more or less—at one time 13 hours on a single bar, and have "tied up" each night. But this is unusually slow, as the river is very low and the steamer too heavily laden for the water. In higher water much greater speed is made.

#### Our Steamer—and How it Gets on.

The constant performances of our craft, in the way of getting forward, or backward, or sideways, are "as good as a play." The almost ceaseless call of the man at the bow, as he tests the depth of the current with a marked pole, "f-o-u-r feet," "s-i-x feet, 5 ft., 3½ ft., 2½ ft., 2 ft., 7 ft., n-o-o bottom" (if it is over 8 feet), and so on, each call

Fig. 1.—A STERN-WHEEL STEAMER ON THE UPPER MISSOURI.

repeated to the pilot by the man on the upper deck, does not become monotonous, for each passenger is always guessing silently, if not aloud, what will be the next call, and whether we will not bump upon a sand-bar. If we do, the "sparring off," and the way it is done, furnish further entertainment. Enclosed, we send an original pencil sketch of the outline of a Missouri River Steamboat upon which we have passed many days. [The accompanying engravings are made from Mr. Judd's sketches.] All the upper works rest upon a strong flat-bottomed hull, some 4½ feet deep, but sinking in the water only 20 inches or so. Length of steamer about 200 feet; width 45 feet. The height above water is 23 feet, besides the pilot-house. With so light a hold on the water the boat is an easy prey to the high prairie winds of autumn. It is propelled by the great stern wheel with much force against the rapid current, which often runs 6 to 10 miles an hour.

#### "Sparring Off."

The bow or front of the boat is loaded 5 to 10 inches deeper than the stern, so that when a sand-bar is struck it can be more easily backed off by reversing the wheel. But it very frequently goes fast on. Then out come one or more "spars." These are logs, 30 to 40 feet long and a foot in diameter, with blunt bottoms to press against the

Fig. 2.—AN INGENIOUS "DRY DOCK."

sand or mud, and heavy iron spikes in the lower end. Each spar is hung upon a rope, and raised or lowered by steam force. Powerful ropes run through pulley blocks at the tops of the spars, and around other sets of pulleys fastened upon the sides of the bow. By dropping the end of a spar into the water, and applying the steam power, by means of the capstan, or "nigger head" as they call it, the boat is shoved to one side or the

other, or backward. Or if far on the bar, and there is deep water ahead, a spar on each side may lift it over. So some of our progress is really made on "stilts." Owing to the frequent changes of sand-bars, and their uncertain location, the pilots often have to try two, three, four, or more apparent channels, and back out, before finding one that the boat can get through (as shown in figure 4).

#### An Extempore "Dry Dock."

Our steamer chanced to strike a "snag" (a sunken tree), which opened a rent in her side near the bottom of the perpendicular hull, and this a thousand miles from any repairing dock! Did they give up in despair? Not at all. The boat was run upon a shelving sand bottom near the shore; powerful ropes, fore and aft, were run out to trees, and by steam power the hull was drawn sidewise firmly into the sand (fig. 2). Stones were gathered, and two walls built from the boat to the dry land, one above and one below the fracture. These walls were made water-tight by scores of barrels of mud and sand, and the water was then taken out from between the stone walls, leaving the broken place exposed. It was speedily replanked and caulked, the boat sparrowed off into deeper water, and on we went, with only a brief detention. These hardy, ingenious, wide-awake western navigators are full of resources, and one soon comes to trust to their meeting and conquering any and every difficulty.

#### Safe and Comfortable Travelling.

Despite the snags, and sand-bars, and the remoteness of the Upper Missouri, travelling is quite safe. Snags are very seldom struck, and then hardly ever seriously. As for these and other annoyances, the enterprising western men are sure to find a way out, and if worst should come to worst, the river is seldom so deep that one could not wade out to the shore or to a dry sand-bar—a safety not found on deeper water. The state-rooms are comfortable on the larger and newer boats; the fare is good, substantial—in fact good enough so far as we have found it. Those who cannot cheerfully put up with a little inconvenience better not travel anywhere.

#### The Channel is very Crooked.

A straight-a-way run of 2 or 3 miles is the exception. The river takes great curves, often at sharp

Fig. 3.—THE CROOKED MISSOURI RIVER.

angles, bending back almost upon itself at times. At one place, after going 45 miles, we were only three miles across the neck from where we had passed several hours before. Usually there is, on one side or the other, often on both, a "bottom," varying from a few feet to miles in width (fig. 4). This is a bed of clay and sand and black deposit, 4 to 15 feet above low water, and just above ordinary high water. Where it has been undisturbed a few years, it is often covered with Cottonwood trees, which increase from half to three-fourths of an inch in diameter yearly. But the channel is ever changing—a freshet, the lodging of a floating tree, or other slight cause, will start the water off in a new direction, and so, on one side or the other, the edges of the bottom lands are ever wearing away, and the washed out soil is deposited in the slower current. The water is of course always filled with mud. A tumbler of it standing until settled, will show fully an eighth of an inch deposit. It is a darkish-clay color. The water from the Yellowstone River, we noticed in passing its mouth, is of a slightly reddish or yellowish mud—hence the name of that river. The bottom lands are very fertile, and when high enough to be safe against prospective washing out, as is often the case, they furnish most excellent farm lands. On the north side of the Missouri, from the Yellowstone to Wolf River (180 miles, or 90 to 100 miles by land), we should say, at a rough guessing estimate, there are a million acres of fine bottom lands—perhaps more—and there are other millions of acres along the Upper Missouri.—The climate between latitude 47° and 49° though cold in winter, is felt less severely than in lower

countries, and many farm crops grow well. At Berthold Agency, latitude 47° 30', wheat has been grown successfully; while this is one of the leading crops around Winnipeg, which is above lat 50°.

#### Bench and Uplands.

Back of the "bottoms," a few feet higher, are the "bench lands," extending to the foot of the "bluffs." Sometimes they are narrow strips a few feet wide, oftener entirely absent; sometimes half a mile to a mile or more in width; and, like the bottoms, are sometimes on one side of the stream,

Fig. 4.—SPECIMENS OF MISSOURI SAND-BARS, ETC., AND THE STEAMER'S COURSE THROUGH THEM.

sometimes on the other—seldom on both sides at the same point. These are similar to the average prairie soil, and where they exist in sufficient width, will be excellent localities for farms—for grain and corn especially. The adjacent bottoms supply plenty of grass, and when broken yield corn, potatoes, and indeed all crops suited to the latitude. Back of the bottoms and bench lands where they exist, are the "bluffs" forming the sides of the general river valley, which varies in width, between the bluffs, from half a mile to two, five, eight, and in one place to fifteen or twenty miles, averaging, we should guess, 2 miles, for 600 miles above Bismarck. These are mainly sloping irregular banks, rising 30 to 100 or more feet above the river, the sides cut into dells, or cut down by water and frost, with now and then little valleys running up and out at the top, filled with trees—in which case they are called "Coulees." The bluffs are, however, cut into all sorts of regular and irregular forms, often weird and fantastic, frequently of great beauty, and presenting an ever-changing scenery that gives a charm to one's journey. From the top of the bluffs—which are seldom "bluffs" as that term is usually understood—the country runs back as a level, treeless prairie, more or less rolling in many places; in others broken into hills and hollows, and here and there intersected by the wide "bottoms" of rivers or creeks that flow into the Missouri. A good map will show many of these affluents, some of them of great length, as the Little Missouri, the Milk River, the Big, Little, and Lower Muddy, the Cheyenne, etc., besides the large Yellowstone.

#### "Bad Lands."

Strictly speaking, we suppose this term applies to those lands which are very hilly, and covered with a dark-colored, finely-broken stone, allowing very little vegetation. It is here, apparently, applied to all land not fit for cultivation, whether too sandy, too dry, or too alkaline. Such lands are frequent, back from the river, along most of the Upper Missouri, but there is much good land also that will in due time, and not very far distant, come into cultivation. The "bottoms" and the "bench lands" along the Missouri and its feeding streams, will afford good land to sustain a population of hundreds of thousands, not to say millions.

#### Among the Indians.

We write this, surrounded by many thousands of nearly uncivilized Indians, including 1,500 to 2,000 "hostiles," who have come from Sitting Bull's bands, just over the line in British Territory, on a foraging excursion. These all live in Lodges, or "tepees," that is, conical tents covered with tanned Buffalo skins, the hair removed, and sewed together. It occurs to us that our readers will be interested in some brief general notes on the aborigines.... For 250 years the Indians have had a certain relation to the agriculture of our country. The ever increasing demand for new land to cultivate has led to a continuous struggle for obtaining

it, by fair means or by foul, from the aborigines who claimed ownership and were in possession. The red line of war and massacre, stretching from Canada to the Gulf of Mexico has gradually moved westward, sweeping over nearly the entire country, for two centuries. Many pioneer settlers on the frontier have worked with rifle always at hand for protection, and many have fallen by savage hands.

#### To-day all this is about Over.

During the past few years almost the entire Indian population has been gathered upon Reservations, and nearly all of them are now peacefully occupying their limited areas. These reservations, marked upon an ordinary map of the whole country show only a small spots, with three or four exceptions—the Indian territory south of Kansas, the Sioux territory in western Dakota, and the one where we now write, viz., that between the Upper Missouri and Canada, including some land south of the river. Leaving out Alaska, the total amount of land thus reserved was reported in 1879 as 255,600 square miles, and the number of Indians of all ages, 252,897. These Indians are grouped under the direction of about 70 government agencies. Over three-fifths of the lands reserved are at three points: in the Southern Indian Territory, 64,214 sq. miles; the Sioux reservation in western Dakota, 49,176 sq. miles, and the Fort Peck and Black Feet reserve in northern Montana, 41,330 sq. miles—in all three 154,620 sq. miles, leaving but 104,000 sq. miles for all other lands allowed to the aborigines, and the recent cession of the Ute territory in Colo-

land ("much big land"), more implements and more seed. And this too among the most uncultured tribes, many of whom were engaged in the fighting of 1876 when General Custer was slain.

#### A Most Worthy Consummation

it will surely be, if, as is possible, during the present decade, the entire aborigines of the whole country are settled down to actual agriculture, each on his own farm, deeded to him individually. We can surely grant this. Allowing five to a family, and 160 acres to each family, no more land would be needed than is comprised in less than one quarter of the single State of Illinois or of Iowa, for all the Indians of the country.

PARTLY CORRECTIVE.—In the advance copy of Sept. number, just received, we notice two errors in the last paragraph of Notes, on page 340, which was sent by telegraph—an error of the operator, doubtless. We wrote that the wheat crop of Minnesota was unusually fine in the north-west. There is comparatively little wheat yet grown in the north-east part of this State. Again, in speaking of the Americans and foreigners settling on the N. P. R. R. lands, we wrote the "former probably predominating"—not foreigners, as the telegraph made it. This is not important; but it is a matter of interest that, of the new settlers along that road, a large number are from the older States. Foreigners, we judge, go more largely to Western Minnesota, to Dakota, and Nebraska, except where they cross the line to Winnipeg, as many English emigrants do to keep under the same government as at home.

Fig. 1.—SIDE ELEVATION OF HOUSE.

rado reduces this amount. The total land now even nominally occupied or allotted to the entire Indian tribes is 16,000 sq. miles less than the single State of Texas—or about equalling Montana and Idaho.

#### Indian Agriculture in the Future.

The present policy of the Government, and of all interested in the welfare of the Indians, is to as rapidly as possible get them to give up the chase, and devote themselves to the cultivation of the soil and stock raising.\* And we are happy to report that there is a good prospect that the desired object will be obtained ultimately, if the present policy be carefully and judiciously persisted in for a few years. For example, away up here, 200 miles above the mouth of the Yellowstone, on the north side of the Missouri, we find some 800 Indian families engaged in cultivating their allotments of land, growing as fine potatoes as we have ever seen, very good corn, oats, pumpkins, etc., using all the land that could possibly be broken and seed obtained for it. In a grand Council with the Chiefs and warriors here, an earnest wish was expressed for more

\* The writer only consented to serve on the Board of Indian Commissioners, because urgently solicited to do so for the aid he could give in this special direction.

#### A Convenient Cottage, Costing \$1,000.

BY S. B. REED, ARCHITECT.

These plans are for a dwelling similar in character to those published in the September number of the *American Agriculturist*. The divisions and general arrangements are changed, and the side entrances reversed, adapting it to locations having an opposite approach.... **Exterior.**—Two elevations are given. The sides (fig. 1) are 34½ feet long, of which 16 feet forms an end to the front, or main part. The rear or wing portion is carried up to the full height of the front, and has the same general finish. The front (figure 2), has a breadth of 25 feet, with foundations showing 2 feet above ground. The openings and other parts are symmetrically arranged, and the whole tastefully finished. The principal roofs have a pitch of 14 inches to a foot, giving them unusual prominence. The chimneys pass through the ridges, where they appear to the best advantage. The two porches are sufficiently large to protect the entrances; the front one is furnished with permanent seats at either side.... **Cellar** (figure 3).—Height 6½ feet. In this climate it is necessary for all trench foundation walls to

extend into the earth from two to three feet to insure them against destruction from frost. If we set our building two feet above ground, and houses in the country should never be less for healthfulness, such foundations, including the portions below and above ground will measure from four to five feet in height. For the small expense of the excavation,

Fig. 2.—FRONT ELEVATION OF HOUSE.

and a few additional bottom courses of rough masonry, all such foundation-walls may be utilized to better advantage, and a valuable cellar will be obtained. With these facts in mind, it will be seen that there is no real economy in trench foundations, especially where it is possible to have a cellar. In this plan the cellar extends under the entire building. Six small windows give light to all parts, and an outside door opens to the area under the rear porch. A flight of stairs lead directly to the kitchen....**First Story** (figure 4).—Height of ceiling, nine feet. A Parlor, a Living-room, and

Fig. 2.—PLAN OF THE CELLAR.

Kitchen, each of nearly equal dimensions, form the principal divisions of this story. The two front rooms are entered from the front porch through the vestibule. Each has out-looks to the front and one side. The Living-room is also accessible from the rear porch through the entry. A fire-place is put between the Parlor and Living-room, which may be made to face either way, and suited to the use of a

fire-place heater. The latter may be so arranged as to communicate heat to each of the four rooms in the main part. The Kitchen is a pleasant and convenient apartment; it has windows in three of its sides, a large open fire-place suited to the use of a range, two closets and a sink, and communication directly with the rear entry and the cellar stairs.

The Stairs to the second story lead from the entry, with platform and winders near the top....

**Second Story** (figure 5).—Height of ceiling, four and one half feet at the plates, and following the rafters to the full height of eight feet. There is a hall, two chambers, two bedrooms, and two closets in this story. Each room has good-sized windows, and adjoins chimney flues, giving opportunity for the use of stoves if required. The Hall has a small window just above the stair platform, giving light to the hall above and the entry below. Inquiry is sometimes made as to "what constitutes the difference between a chamber and a bedroom." The term "chamber" is applied to such sleeping apartments as will contain a full suit of chamber furniture, consisting usually of seven pieces; and

"bedroom" to such as have only space for a partial suit of perhaps three pieces....**Construction**.—The foundations are of hard brick and mortar, eight inches thick. The frame of sawed timber; siding, of "Novelty" pattern pine; roofs, of sawed shingles; floors, of spruce T. & G. The windows are glazed with second quality French glass; doors of pine, four-panelled and molded; plastering, hard finished. The casings inside, of white pine, and in the front rooms molded. The mantel shelves are of ash plank, supported on neat trusses. Painting, two coats....**The Estimate** for the average cost of this building is given below:

75 yards Excavation, at 25c. per yard.....	\$ 18 75
12,000 Brick foundation and chimney, laid, \$12 per M 144 00	
455 yards Plastering, at 20c. per yard.....	91 00
2,150 ft. Timber, at \$15 per M.....	32 25
2 Sills, 4x7 in. 25 ft. long.....	1 Ridge 2x7 in. 31 ft. long.
3 Sills, 4x7 in. 16 ft. long.....	1 Ridge 2x7 in. 25 ft. long.
2 Sills, 4x7 in. 19 ft. long.....	38 Beams 2x6 in. 16 ft. long.
2 Plates 4x6 in. 25 ft. long.....	4 Beams 2x7 in. 12 ft. long.
2 Plates 4x6 in. 19 ft. long.....	2 Valleys 2x7 16 ft. long.
8 Posts 4x6 in. 14 ft. long.....	
250 Nail Strips, at 12c. each.....	30 00
30 Joists, at 15c. each.....	4 50
125 Siding, 9 1/2 in., at 28c. each.....	35 84
Cornice materials.....	15 00
300 Shingling Lath, at 6c. each.....	18 00
45 bunches Shingles, at \$1.25 each.....	56 25
60 ft. Tin Valleys, at 8c. per ft.....	4 80
152 Flooring (inside), 9 in. wide, at 28c. each.....	42 56
30 Flooring (outside), 4 1/2 in. wide, at 15c. each.....	4 50
6 Cellar Windows, at \$3 each complete.....	18 00
14 plain Windows, at \$5.50 each complete.....	77 00
18 Doors, at \$5 each.....	90 00
2 Porches, \$25; 2 Stairs, \$16.....	41 00
5 Mantel Shelves \$10; Closet finish, \$6.....	16 00
Nails, Pump, and Sink, \$25; Painting, \$75.....	100 00
Carting, \$15; Carpenters labor, \$125.....	140 00
Incidentals.....	16 55
<b>Total.....</b>	<b>\$1,000 00</b>

**Hereford Cattle**.—Enterprising breeders and dealers are, it seems, taking advantage of the great favor in which this excellent breed of cattle is held, to buy in England almost everything that is fit to import and has a fair pedigree. One breeder, Mr. T. L. Miller, is about landing some 109 head of Herefords. This "boom" in favor of the Herefords is not to be wondered at. They are one of the ancient races of Great Britain, of which the Devon is another, differing from the more artificial breeds in possessing a greater permanency of type. Their white faces and strips on belly and shoulders are, though very noticeable, a cultivated feature, to a great extent added within the past 100 years. As we now find them, they are exceedingly uniform in their characteristics, grow quickly, are early and profitable feeders, of good weight, excellent handlers, very low set, a little strong in bone, and

the cows reputed poor milkers. They are superior to the Shorthorns on poor feed, stand privation, short pasturage, and lack of water better, at least so it is claimed, and hence are great favorites on the Plains. The butchers favor them

Fig. 4.—PLAN OF FIRST STORY.

because the flesh is well marbled, and cuts up to profit. Their advocates in this country, from Mr. Sotham to Mr. Miller, have been most faithful in presenting their claims as against the Shorthorns, often fairly tiring out the general reader or any one not directly interested. The beasts were not particularly attractive, sold at low prices, had short pedigrees, if any, and were only beef cattle, while their rivals were fashionable, had long pedigrees, were stylish and beautiful, were excellent both for beef and milk, and sold for higher prices than any other breed of cattle by far. Now the tables seem

Fig. 5.—PLAN OF SECOND STORY.

to be turning—beef is everything for the far West. Hereford pedigrees are at least sound, while every breeder of Shorthorns is picking all the flaws he can in the pedigrees of every family except the one he breeds himself. Hurrah for the Herefords.

### The Jersey Bull "Mercury" (432).

"Mercury" is the only living son of "Jupiter" (93), and "Alphea" (171), he was dropped October 7, 1869, and was bred by Col. R. M. Hoe, of Morrisania. His sire and dam were own brother and sister, the progeny of "Saturn" and "Rhea," who are famous only for having been the progenitors of these two animals, and especially of "Al-

equal either his dam or her famous grand daughter, but there are no inferior cows among them, that we know of. Many of the second generation are exceedingly fine animals. Among the bulls the most famous is "Polonius" (2531), by "Sarpedon" (930), out of "Leda" (799), owned by Mr. John D. Wing, and so far as we know the only other "pure Alphea" bull except his sire. What is meant by a "pure Alphea" pedigree, is one which traces on

### Seeding to Grass in the Fall.

The common practice of farmers in the North is to seed in the spring, in connection with spring wheat, barley, or oats. We recently visited a farmer who has practised seeding in the fall for many years. He followed spring seeding, and found that the grass seed made a small, poor growth under the oats, and the roots did not get strong enough

JERSEY BULL MERCURY (432).—THE PROPERTY OF WILLIAM SIMPSON, ESQ., OF WEST FARMS, N. Y.

Alphea." "Mercury" is a handsome, solid colored animal, as indeed are most of "Alphea's" progeny, and Col. Hoe retained him for his own use, when he sold most of his herd. He subsequently parted with him to his nephew, Mr. Herbert Mead, by whom he has long been used, though repeatedly offered for sale at absurdly low prices. Ten years of service have given him many sons and daughters, and though now eleven years old, he is healthy and vigorous. He was bought last spring by Mr. Wm. Simpson, of West Farms, a near neighbor of Col. Hoe's, at a large price, and now heads his famous and beautiful herd at New Hudson, Alleghany Co., N. Y. His dam, and so many of her descendants have proved extraordinary butter producers, that it gives great value to his blood. About the same time that he bought "Mercury," Mr. Simpson bought his full sister "Europa" (179), the dam of "Eurotas" (2454), an account of which famous cow was given in the *American Agriculturist* for August, page 305. To the record of her butter yield, given at that time, we may here add, that within ten months after calving, that is up to September 10th, she yielded the unprecedented amount of 752 pounds of butter, and is still producing, October 1st, over a pound of butter a day. Among "Mercury's" immediate get there are no cows which

all lines to "Jupiter" and "Alphea" whose blood was identical. So long, therefore, as we have "Europa" and other "pure Alphea" cows, the line of "Alphea's" descendants may be continued without alloy. Mr. Simpson claims for his herd the distinction of having more of the blood of "Alphea" than exists in any other. He is breeding for butter, making all other qualities subservient to this, and has several remarkable young cows of entirely different strains upon which to prove the effect of the "Alphea" cross.

Breeders of Jerseys have too often followed the lead of the breeders on the Island of Jersey, who use, with hardly an exception, only yearling bulls, fattening and killing, or selling their bulls, even the best of them, soon after they are two years old. Thus they never know what the quality of a bull's get is, until after his death. Certainly not a wise system. Here we have not done much better, for bulls are generally killed about the time the oldest heifers of their get come to the pail. Old "Mercury's" long life of usefulness and his present vigorous old age, his gentle manners, and the health, good size, and good quality of his latest calves, is a sufficient argument against "turning off" a good bull when just in his prime. "Mercury" has years of usefulness yet to come.

in the growth after the oats were removed, to carry them well through the winter. He now seeds with rye, using about a hundred bushels of ashes to the acre where he lays down for meadow. His rotation is somewhat peculiar, and prepares the way for the remarkable success of his meadows, which last eight years, giving good crops of grass. In a ten-acre meadow under this treatment in its second year in grass, there were at least two tons of hay to the acre. He begins with the corn crop, applying to it all the manure upon the farm. Corn occupies the ground for one or two years, according to the condition of the land. If rich, mellow, and clean enough to suit his standard, the corn is followed by oats without manure. These are usually very heavy, both in straw and seed. Rye is the third crop in the rotation, taking all the ashes; they are procured from Oswego, and come by canal boat from that city without change to his wharf, three miles from the farm. At the cost of twenty cents a bushel at the wharf, he finds these the best fertilizer for his soil he has ever used. They last for eight years, giving good crops of grass without plowing, and the effects are seen for six years longer in the subsequent rotation. With the manuring practised upon his farm, we have no doubt fall has an advantage over spring seeding. W. C.

## Pig-Pen, Hen-House, and Corn-Crib Combined.

BY WM. B. WIGGINS, HINTON, W. VA.

In order to make the most out of farm land in West Virginia, it is found necessary to economize space in erecting the buildings required for successful farming. The accompanying sketches may serve to give the reader the plan for erecting in a hill side, under one roof, the three important farm buildings named at the head of this article.

Figure 1 is a side view; fig. 2, a front view, and fig. 3, a floor plan of a Pig-pen; fig. 4, is a floor

Fig. 1.—SIDE ELEVATION OF BUILDING.

plan of the Hen-house; and figure 5, shows a longitudinal section of the whole building.

The Pig-pen is constructed of stout framing, and where it comes in contact with the hill side, is protected by dry stone walls. The roof of the sleeping room, *B*, (fig. 3) forms the floor of the Hen-house. *G*. To prevent the dirt from one room being thrown into the other, the door of communication between them, *O*, is raised six inches from the floor and an inclined plane with a cleat is placed on either side to make it easy of ingress and egress. The feeding room, *A*, is protected from the weather by the corn-loft floor and the overhanging eaves. The Hen-house, fig. 1, is situated immediately over the sleeping room of the Pig-pen. It is ventilated by a wire-sash window at *H*, provided with perches (*R*, *R*, fig. 4) 18 inches from the floor at the lowest point,

Fig. 2.—FRONT VIEW OF PIG-PEN, ETC.

and nest boxes on two sides, which are reached by doors on the outside, each door being a hinged plank the entire width of the building, as shown at *S*, figure 1. By this arrangement of the nests, the room need not be entered in quest of eggs. As will be seen by the section, fig. 5, the roof of the Hen-house forms an angle of about forty degrees; this being also the floor of the rear of the Corn-crib, it aids by its slope in readily filling the crib. The Corn-crib, *D*, is approached at the rear where a

slatted door, corresponding with the large slatted front window, give sufficient ventilation for the corn. At *F*, is the platform from which to fill the crib. The building is 10 feet wide by fifteen feet in length, but may be increased in size as desired.

## Sheep Husbandry vs. Dog Raising.

Since the illustration of a remarkable sheep convention in these pages, a number of years ago, at which a dog was publicly executed as a malefactor, sheep raising has made marked progress, in almost all parts of this country. There has been a steady increase in the number of sheep, and improvement in the quality of the wool and mutton. In the latter respect, the change has been quite remarkable in the Northern and older States. We can remember that mutton was looked upon with disfavor in the rural districts, and was seldom seen upon the farmer's table, from autumn until spring. In the smaller local markets, outside of the large cities, it was hardly possible to get sight of a mutton leg, after the new year came in, until the time of lambs and green peas. For half the year, at least, a man of well educated appetite, must needs go to the city, if he wanted a taste of boiled mutton and caper sauce. We are glad to say it is not so now. Though mutton is by no means as common as beef, or veal, in the spring months, the hatcher almost always knows of an intelligent farmer, who has a few fat wethers, that have been grained during the winter, which he will dispose of for a consideration. The butcher has customers who know a good thing when they see it, and will not stand on the price of a South-down loin, or leg. Mutton is not as cheap as it ought to be, but still it can be had, every week in the year, if one is able to pay the price. Intelligent farmers, who study the markets, find it profitable to raise the mutton breeds of sheep. A South-down or Cotswold ram, running with their flocks, secures larger and better lambs, which pay well whether sold the first season, or kept two or three years for wool, and mutton. They are not only profitable for their wool, and carcasses, but they improve the pastures where they feed, more than other stock, by the closer grazing, and the more equal distribution of manure. Farmers are taking much better views of sheep husbandry, and in many of the Northern States have secured effective legislation to protect their flocks against dogs, which have always been the great hindrance to sheep raising. Connecticut has an admirable law, which is gradually restraining the dog nuisance. Dog property is heavily taxed, and the thriftless citizen, who inclines to the chase, has to pay for his indulgence. For the male dog, he is taxed two dollars, annually, and for the female six (\$6), so that puppy raising is a rather expensive luxury. The money collected from the dog-tax, goes to pay for the damages inflicted upon the flocks by dogs. We are glad to say, that this law is not only upon the statute hook, but is executed with commendable vigilance. Every sheep owner is a spy upon his neighbor, who cultivates dog flesh, and it is difficult to hide any cur of high or low degree from the tax-gatherer. Unregistered dogs are dispatched without mercy. Farmers, as a rule, recover the full value of the sheep killed, or maimed by dogs. The law works most kindly upon the sheep interest, and we shall soon have lamb, and mutton as cheap, and plenty, as veal, and beef. In all parts of the country, there is a steady growth of this interest, as capital becomes invested in flocks that are made secure.

CONNECTICUT.

Fig. 3.—THE GROUND PLAN.

## Rocky Pastures—What to do With Them.

In many of the Eastern States there are rocky pastures in great abundance that have been grazed for a hundred years or more, and do not now yield grass enough to pay the taxes upon them. The stones and boulders

are so thick that they cannot be plowed. It would cost from one to four hundred dollars an acre to clear them of rocks by the most economical methods, and it will not pay to do this until there is a great increase of population and a large advance in the price of land. They do not pay as pastures, for the cattle have so far to

Fig. 4.—PLAN OF HEN ROOST.

travel for their food, that they are about as hollow at night as in the morning. If trees start in them they are dwarfed by the perpetual cropping of the cattle. Though poor in grass, these pastures are not necessarily poor land. They may have all the material needed to grow forests, and were probably once covered with a heavy growth of timber. The best thing that can be done with these old pastures in the districts remote from good markets, is to turn them into woodlands. Many of them are already covered with patches of brush and briars, and if cattle and sheep were kept out of them, they would be in a few years covered with young trees. The process may be greatly hastened by sowing the seeds of timber trees, or by planting the young trees. This crop, once started, requires no labor except to keep out cattle by fencing. The value of the capital invested in such lands is small. The growth of the timber for twenty-five or thirty years would be a large interest on the investment. If oak or hickory were planted, there would be several harvests of hoop poles before the final clearing of the main growth of timber. No investment of capital can be more secure than this, and no property more certain to rise in value. Patches of woodland in the midst of cultivated farms are in little danger from fires, for help is always near to extinguish them. The demand upon our forests for fuel and for timber is so steady and persistent, that nothing can be more certain than higher prices for lumber in the next generation. All buildings and structures of wood are short lived, and must be renewed.

Fig. 5.—SECTIONAL VIEW OF BUILDING.

Railroads consume ties by the million annually. In most farming districts wood will be used for fuel and fencing for generations to come. It fills so many places in the economy of farm life, and in the arts, that we shall never be able to dispense with it. Forests have an appreciable influence upon climate, and in summer drouths and spring floods warn us

that we have already encroached too much upon our woodlands. It is not so much more land, as better land, that we want in all the older States. One acre well fertilized and tilled will yield more profit than ten acres half starved and neglected. We may safely reduce the breadth of our pastures and increase the depth and fertility of our meadows.

### Among the Farmers.—No. 58.

BY ONE OF THEM.

Chemists tell us that the bodies of men and animals consist of water, to the extent of 80 to 87 per cent. What wonder, then, is it that water is so important a part of our diet. Next to pure air, pure water is the greatest necessity of our nature. Whenever a new country is settled, the first houses are always built near springs. Where men colonize—that is, settle a country in groups of families, the settlements are when possible clustered about

#### Springs of Water.

Springs are less likely to be contaminated by organic impurities than wells, because they are the out-cropping of usually underground streams, and are independent of local sources. Hence spring water is almost always agreeable to the taste, pure and limpid, and uniform throughout the year. There are not a few wells in this region (Bergen County, N. J.), which were originally flowing springs—now stoned up and appearing as if they had been dug. With these there is always an out-flow through the soil, or by some artificial channel.

#### Wells and Health.

The ordinary source of water in any tolerably well settled region, is the well. Scattered springs are indeed used, but there are not enough of them. So the settlers dig wells, happy if they strike permanent water within 25 feet from the surface. These wells are located with reference solely to the convenience of getting to them from the house, unless, indeed, the striking of a vein of water proves to be an uncertain thing, and the wells are located by the witch-hazel rod, in which cases they may be placed in all sorts of inconvenient positions. The idea of placing them where the source of the water will be uncontaminated is never—hardly ever—considered at all. It is no unusual thing to see the privy vault and the well in near proximity. A well placed half way between the house and the barn, is quite common, and if the barn-yard is fully fifty feet away it may be regarded as a piece of good luck rather than an evidence of design.

The pig-pen generally has a yard which soon becomes a pit full of water in wet seasons—often overflowing and soaking away into porous soil. The house slops are thrown, more often than not, where they will run off into the vegetable garden, or upon the ground close to the privy, where a pool is formed, the overflow of which gets into the vault, perhaps, or evaporates into the air.

#### Pure and Impure Air.

Defilement to the well water, and certain contamination to the air, come or may come from all these sources. We get on very well for years. The pure air of heaven is a blessed thing. It blows from the north-west cool and bracing; it comes from the east laden with the beneficent rain, and the balmy breezes of the south come to us freighted with the odors of the ocean and the shore, salty and health-giving. It is near home that the air is polluted. I have noticed the odor of a pig-sty two miles off with a piece of woods between, and I have no doubt, had my perceptions not been blunted with the many odors of civilization, or had I come fresh out of the mountains, the odor might have

been oppressive twice as far away. The ozone in the air, and the sunshine, and the frost destroy the germs of disease with which we load the air around our dwellings, but the water retains them.

#### A Notable Case of Well-Poisoning.

One of the most ancient dwellings in this vicinity, used as headquarters by American officers in the Revolution, and occupied ever since by people of wealth, many of whom moved into the country for the

health of their families, has a privy vault located some 60 to 80 feet from the dwelling on lower ground. The well stands near the house, and quite as far from the vault, on ground higher still. The roots of an Ailanthus tree some how penetrated to the water, and were supposed to cause a change in it. So the tree was cut down, the roots cleaned out of the well, and it was supposed to be purified. This season, that dreaded disease, diphtheria, has been in the neighborhood, attacking only those whose systems were adapted to give it a lodgment through the subtle influences of foul air or foul water, decaying vegetation in the cellars, obstructed sink drains, putrefaction in privy vaults, or some such cause. The family occupying the old mansion was visited; nine out of perhaps fourteen persons in two households were attacked, and, for a

Fig. 3.—THE DRAWER SYSTEM.

wonder, only one died—a little girl. Then, of course, everything was examined, cleansed and purified. The privy was found with some four or five feet of water in the vault, as it had been from time immemorial, except in very dry seasons. This was a bubbling, seething mass when disturbed—odorous and vile. Half a barrel of strong solution of copperas was poured into it, and a great change was at once perceived, and not here alone. The well water, which had been used both for drinking and washing, suddenly became very "hard," and upon examination was found to contain large quantities of copperas, showing absolutely that there was then, and doubtless for years had been, a direct communication from the privy vault to the well. In the accompanying sketches, figure 1 shows the position of the house, well, and vault, and figure 2, the probable relations of things beneath the surface of the ground. W is the well, V the vault, and S indicates the position of the low and partly swampy ground. The dotted line, A, B, in figure 2, indicates the supposed level of the water in the soil during a wet time, when it is quite probable the flow of water might be from B towards A. But, after a dry time, when the water level might be as low as the surface of the water as represented in the well, if a heavy fall of rain should take place, the water would rise in the swamp first, and would then flow towards the well, carrying defilement and death, either directly from the vault, or from the soil in the vicinity of it, saturated by its overflow. This terrible experience will be unheeded by the

Fig. 4.—THE PLATFORM SYSTEM.

great proportion of the population. Other privies will contaminate the wells. "Malaria," as it is sagely called, will cause bilious fevers, and chills and typhoid fever, and diphtheria perhaps, and the air will take the blame instead of the water. The thing to do is to arrest and destroy the germs of disease of every form both in the air and water.

#### The Plague Spot

of most farms is the privy vault. The older it is, the more dangerous. The only perfect safety seems to be in the earth-closet, or something of the kind. The proper course is to move off the privy, empty the vault and take it up, dig out the discolored earth on the old site, and fill up the hole with earth and stones. Then to arrange the privy with a strong drawer made water-tight, the ends being strapped with hoop iron. This should be placed beneath the seat, and about three feet below it. In use, very dry sifted earth is spread over

the bottom of the drawer to the depth of about three inches, and the accumulations covered daily with additions of dry earth, or in winter with earth and coal ashes. This may be done in any convenient way, best perhaps, by lifting a shutter at the rear, and scattering in a few shovelfuls of earth and levelling it off. When the drawer is full it is removed by drawing a stone-boat alongside, placing the drawer upon it by means of a crowbar or other lever, when it may be taken away and dumped, either in a compost heap, or directly upon the land. I have tried several methods—having the drawer upon runners—using no drawer, but a platform accessible from the rear, the earth being thrown on daily, and the accumulations removed by the shovel

and carted away. For an ordinary family the drawer system is best; for a family of, say, ten members, the platform plan is perhaps most convenient.

Figure 3 represents the drawer system. Figure 4, a privy with a platform. A piece of 4 by 4 scantling, laid down on the platform, keeps the accumulations in place, and there should be room under the extension of the roof for barrels or bins of dry earth, or swamp muck, which, if fine and dry, is just as good as the fine dry earth.

#### Hand-Gauge for Measuring Horses.

It is often desirable to know exactly the height of a horse. I have found it so, as I wanted from time to time to know how my colts were growing. The instrument shown in figure 5 is made for this purpose. I found it in use at a sale stable, and constructed one like it. The upright is a square rod of 1½-inch yellow pine, 6 feet 2 inches long, and from the 6-foot mark downward is graduated by "hands"—a hand is 4 inches, consequently 6 feet, or 72 inches, is 18 hands. The height of horses is from 15 to 18 hands. That of ponies from 8 to 14 hands, so that we need to have our measuring-rod graduated only between 32 and 72 inches. The "hands" are divided into inches, which, of course, are quarter hands, and the inches again into quarters, which is as nearly accurate as it is necessary to be. The cross-piece, or index, is also of yellow pine, 6 inches wide at the broad end, and of the shape shown in figure 6. A band of sheet brass, with a piece cut out as shown in the engraving, is bent at two right angles, so that it will slide easily

Fig. 6.—THE INDEX.

Fig. 1.—PLAN OF GROUNDS.

on the upright; it is screwed firmly to the index, so that the horizontal line which is coincident with the lower edge of the index near the end, shall be accurately at right angles with the upright. In measuring a horse, the index must rest lightly on the withers at their highest point, the measuring-rod standing as nearly perpendicular as possible.

#### Feeding Trough for Fowls.

There have been a great many feeding troughs devised for chickens and other poultry, but I have

Fig. 7.—FEEDING TROUGH FOR FOWLS.

never seen one so convenient and practically good as that shown in figure 7, devised and used by my friend, Geo. G. Curtis, of Gravesend. It is made thus: The ends are cut 12 inches square, the upper corners taken off to give a pitch to the roof boards. Two 6-inch boards form the trough, and rest on cleats on the end boards, to which they are nailed. The roof is of 10-inch boards, one of which is nailed fast, the other hinged to it, so that it may be lifted like a lid when the trough is filled or cleaned. It has the following advantages: The feed cannot get wet; the fowls are not able to stand or sit on the edge of the trough, and as the space between the edge and the roof is only three or four inches, they can not get into the trough, and even young chickens are not likely to; it is easy to fill, easy to clean out, very substantial, and strong if not made of too great length. Six feet long is about right.

#### Impurities of Drinking Water.

Professor G. W. Farlow, M. D., of Harvard University, has made an extensive examination into the impurities of drinking water, the results of which are valuable to our readers. Professor Farlow states that, under ordinary circumstances no direct trouble is likely to arise from the growth of the larger weeds in our water supplies, provided the plants are living and flourishing. The disagreeable tastes and odors of many of the waters examined were produced by small plants of a very low order of organization—in fact, microscopic. There are two groups of these microscopic plants—those which are grass-green or yellowish-green, and the bluish-green or purplish sort. From a sanitary point of view, the grass-green plants have no injurious effect upon the water in which they grow, but on the other hand, the purity of the water is indicated by their growing in it. The "moss-covered bucket" brings the pure water from the well. These green water plants (algæ) usually look, to the naked eye, like fine threads, some of which branch, and others do not; they may be either float-

MICROSCOPIC PLANTS CAUSING IMPURE WATER.

ing on or near the surface, or attached to the bottom or sides of the pond, spring, or well. The second group, the bluish-green or purplish algae, is the one that most interests us, as the members of this

group cause some of the most disagreeable odors and tastes found in drinking water. The kidney-shaped, spiny bodies in the accompanying engraving represent clusters of these plants found in impure drinking water, and form a scum upon its surface. Each body is a mass of jelly, in which the bluish-green cells of the plants are embedded. These colonies are very small, and the engraving represents them magnified 300 times. Very small plants have very long names sometimes: this is the *Celosphaerium Kuetzingianum*. This plant is often found with another, which is filamentous, or like the links of a sausage, and is represented with it in the engraving. These and other plants flourish in warm, and especially the hot weather of August and September, but may be found to a certain extent at almost any season. "So long as they are living, and not exceedingly abundant, they produce no perceptible bad effect on the water; but when large quantities of them decay, they give rise to the 'pig-pen odor,' as it is called, which has in recent years caused considerable trouble and still more alarm." Dr. Farlow suggests no absolute remedy, but states that all water places should be cleared of weeds, and other substances upon which these plants may lodge. "Large and deep bodies of water are less likely to be affected than small and shallow ones, and gravelly bottoms are better than muddy. In one respect the fears of the public may be set at rest. The theory that certain diseases, as fever, are produced by germs of some low forms of plant life, whether true or not, has no bearing on the present case." The microscopic plants that make the water unfit for family use, do not cause the various diseases that have been assigned to them.

#### A Barrel Fountain for Pigs.

"L. B.," Omaha, Nebraska, while on a visit at Lincoln of that State, gathered, among other valuable things for the farm, some ideas on stock matters of such interest to himself that he ventures to offer them to the public through the *American*

A SELF-ACTING WATERING BARREL FOR SWINE.

*Agriculturist*. Mr. B. writes: "Mr. C. N. Baird, Receiver of the U. S. Land Office, called my attention to a device originated by himself for watering hogs, of which I give you a rough sketch." The main tank, A, is supplied by a windmill and pump. A barrel, B, is sunk nearly to its top in the ground, at any desired distance from the tank, with which it is connected by a small iron pipe C, C, passing from the bottom of the tank to the bottom of the barrel. A float, F, is attached by a chain, cord, or wire to a lever valve at the bottom of the barrel. When the barrel is full of water, the float is raised to the surface, closing the valve and stopping the flow of water. As the water is drunk, the float drops and opens the valve, as shown by dotted line in the accompanying engraving, when a supply of water comes in and again the float is raised. By packing the barrel and pipe well with mulch when setting, the effects of cold are almost entirely avoided. The cost of this handy watering barrel is not over five dollars. With this apparatus an unfailing supply of clear, pure water is furnished. He has never had a case of cholera or other disease among his hogs, and volunteers the opinion that filthy food and quarters, and especially lack of pure water in abundance, is the main cause of hog diseases. Mr. Baird objects to running streams for water supply for stock.

#### A Muzzle for Biting Horses.

There has been a number of inquiries of late as to an easy and effectual method of curing the habit of biting in horses. This dangerous habit is taught the horses by thoughtless owners or driv-

A MUZZLE FOR BITING HORSES.

ers, by playing with them when colts, or teasing them when full grown. A sharp cut with a whip across the horse's nose whenever he bites may serve to break him of the habit; but when the case is worse and incurable, a muzzle of some sort had best be put upon the horse. A muzzle for this purpose may be made of strips of light hoop iron or of leather. A band is made to encircle the muzzle, to which strips of the leather or iron are fastened, and the whole buckled to the headstall, as shown in the accompanying engraving. At the bottom of the muzzle a round piece of leather should be fastened by rivets to keep the strips in place.

**A Salt Trough for Sheep and Goats.**—Mr. J. G. McArthur, Meridian, Miss., sends a sketch and description of a Salt Trough for small farm stock, and wishes to give the readers of the *American Agriculturist* the benefit of his invention. Mr. M. writes: "I have resorted to various expedients to place a constant supply of salt within easy reach of my stock without having it wasted and defiled by their feet and droppings.... I think that I can now consistently and confidently exclaim *Eureka!*" The following are the dimensions of the Salting Trough as used by Mr. M. The sides, A, A, are 12 inches wide and 28 in. long, with the upper end pointed for the roof; B, B, 9 inches wide and 14 inches long with fork for trough; C, the trough made by placing two 6-inch boards together and resting in B, B. A 6-inch board, E, is fastened to the center of A, A, and 6 inches above the center of the trough to prevent young animals from getting into the trough. Two 3-inch slats, four feet long, F, F, are nailed horizontally to A, A, to prevent the frame from turning over. Two 3-inch slats, G, G, are securely nailed to the edges of A, A,

A SALT TROUGH FOR SMALL STOCK.

and rest upon F, F, as braces to strengthen the frame. The roof is made of two 8-inch boards, extending 4 inches over the end as gables.

**Fodder Corn: Amount per Acre.**—According to Goffart in his work on "Ensilage of Maize," the minimum yield has been 15,000 kilogrammes per hectare; it has risen in 1875 to a maximum of 150,000 kilogrammes upon a field of thirty-six acres. The average yield has been, during six years, about 90,000 kilogrammes the hectare." The minimum

in France is therefore six and two-thirds tons, and the maximum sixty-six tons per acre. A yield of twenty tons per acre is as much as could be reasonably expected, unless the soil has the richness, mellowness, and depth of a fine garden soil.

### How to Dress a Turkey.

There is much practical wisdom among the poultry men, that does not get into the papers or books. A turkey raiser who prides himself on sending to market the handsomest lot of turkeys in his town, for the Christmas market, tells us how he dresses his birds. The turkeys are fed as usual the night before butchering, and in the morning are driven in upon the barn floor, as soon as they come from the roost, and are made secure. Their crops are empty, and they can be caught as they are wanted. Make a slip noose of strong cord for each turkey, in an adjoining stable or shed, put the turkey's legs into the noose, and with a small pointed knife stick the bird as near the head as possible. As soon as the bird is dead, strip off the feathers, pinfeathers and all. Cut the neck off as near the head as possible, remove the wings and draw the entrails, before taking the bird down. The turkey is hung up alive, and taken down ready for market. Lay the bird on his breast or side, upon a clean board to cool. Turkeys should be carefully handled in dressing, to avoid breaking the skin, for it rubs off very easily when they are warm. Remove all the pinfeathers and pack the birds when sent to market, in clean straw, so that there will be no marks of blood upon them. Handsome, clean dressing will add a cent a pound, and often more, to the market price of all kinds of poultry.

### Pitting Corn Fodder.

The good result which many persons obtained last year in pitting corn fodder, leads this year to the making of many pits, or *silos*, for this purpose, all over the country. So that if there is the least question as to the utility of the process, it will be soon set at rest by a thousand experimenters.

We were much interested in witnessing the filling of the pits built by the Messrs. Buckley Brothers, of Port Jervis, N. Y., whom we visited about the middle of September. It has been their habit for many years to put in a large area of sowed corn, which was cut and put up for curing in stocks, and afterwards housed or stacked near the barns. This year they have a larger area than usual, a large part of which they put down in pits for winter feeding. This matter of pitting or *ensilaging* corn fodder has been carefully investigated by them, and they have made, this year, two pits under the cow-barn floor. These pits (fig. 1) are 22 feet long, 9 feet wide, and 15½ feet deep, side by side, with a two-foot wall between them. They are walled all around and cemented water-tight. They would answer well as cisterns. These two are just built, but there is an old one, 10 feet wide, 50 feet long, and 7 feet deep, which is under the feeding floor. The location of these pits is shown in the accompanying plan, fig. 2. The cow-barn is 120 feet long, by 30 feet wide. The feeding floor is 10 feet wide, and the standing space for the cows is the same width on each side. There is room for 36 cows in this stable, up to the barn floor. The floor, the stalls and all from side to side, was taken up for the filling of the pits, but it will be relaid.

At the time we were there the work of filling was going on in full blast. A pair of powerful mules were at work in the horse power. The feed-cutter stood directly behind them, and cut the stalks in half-inch pieces, at the rate of two tons an hour. It required three men to tend the cutter, taking the corn from the wagon, feeding it to the cutter, and seeing that it was properly shunted off into the pits, where one man spread it as evenly as possible, and tramped it down. At noon and evening half-a-dozen men got into the tanks, and tramped the fodder down as firmly as they could. One man and one team were required to haul the fodder from the field. As soon as a wagon load was brought into the barn, the team was ungeared and hitched to the empty wagon. In the field the teamster assisted

in the loading. There were three men in the field cutting up the corn and loading the wagon. Thus the labor required was as follows: Two teams and one driver, four men in the barn and three in the field—eight men in all. With this force they were putting in about twenty tons a day.

The stalks were rather dry; the juice did not squirt out of them when they went through the cutter, and the chaffings were not even moist to the

Fig. 1.—SECTIONAL VIEW OF STABLES AND FODDER PITS.

touch. When packed in the pits, a strong fermentation sets in very soon. The corn that had been packed the day before was steaming hot, no doubt having a temperature of 110° to 120° Fahrenheit. It had a vinous odor which was very sweet and pleasant. Mr. Charles Buckley gave us the figures of the cost of these two pits, which is as follows:

Digging, 112 days work at \$1.....	\$112.00
Masons' bill.....	94.44
Men to assist the masons, 12 days work.....	12.00
Bill for Lime and Cement.....	78.10

Total outlay. ....\$296.54

This does not include anything for stone, for the stones taken out of the pit were sufficient for the walls, and more too. Neither is any charge made for superintendence, and no doubt it would be fair to add fully ten per cent for the supervision, and actual labor, which at one time or another the farmer himself gave, or say \$325 in all. There were 50 barrels of cement used, and about half as much lime, part of which, 8 bbls., was very good, and the rest, 50 bushels, cheap and of a low grade. The proportion of sand to cement and lime in the mortar with which the walls were laid up, was about two-thirds, but in coating over the surface to make the whole water-tight, nearly pure cement was used. Thus the pits were filled, each one receiving its quota of ten tons, more or less, being well trodden down, allowed to settle over night and again trodden down in the morning before work, all hands being engaged in the tramping. When full as possible, settled and tramped, and beginning to heat in the top layers, it is covered with six inches of long rye straw—any other straw will answer—and this, with a layer of planks, cut to fit crossways, but not so long as to bind. Stones are piled or rather laid upon the planks so that fully one hundred pounds to the square foot rests upon the fodder. Thus it is left for winter use. Filled full, one of these pits will hold sixty tons. That is, containing as they do over 3,000 cubic feet, or 2,400 bushels—at fifty pounds to the bushel, which the compressed moist, and almost solid fodder will weigh—this is equal to 120,000 lbs., or 60 tons.

As to the keeping, there can be no question, if

the work is properly done. A brisk fermentation comes on, as we have seen—as it does in a tub of apple pulp for making cider. If the air has very slight access it will go on to ultimate decay; but if it is kept out, the little air at first present is driven off by the carbonic acid gas which is formed, and the mass ceases to ferment, and remains as if it were in an air tight case. There is, however, a slight access of air upon the surface

and its action upon the juices in the straw and upper layer of fodder is just enough to maintain an atmosphere of carbonic acid gas over the mass—and in the straw which is like a rubber blanket, confined as it is beneath the planks. The stable will be replaced over the pits, and when the time comes for feeding there will be no going out in storms and “slush” and ice to haul in the fodder from out-of-door pits, but the floor will be taken up over a sufficient space, and enough feed removed from one end for two days, when it will be packed down again and covered closely. We think rubber blankets, tarpaulins, canvas, or any coarse cloth painted with boiled oil, would be excellent to pack close down upon the fodder to exclude the air. One thing strikes us as very important, and that is, to *know* for a certainty that there is no settling of carbonic acid gas in the pit, after a considerable opening is made. A man going into a place filled with this gas—as often in deep wells—is over-powered before he knows it, falls and drowns as surely as if he were under water, and is even less likely to be resuscitated. The way to *know* whether a man can enter with safety, is to lower a lantern, which, if it burns freely, it shows that there is not a dangerous proportion of gas in the air of the pit.

**Selection of Breeding Stock.**—The art of breeding may be summed up in the one word, *selection*, or it may be expressed in the common rule of good breeding—“Always select the best.” To be able to tell the best is the most difficult point in the breeding of farm stock. The successful breeder must have a clear idea of the qualities sought, and the quickest and best method by which such ends may be reached. He must necessarily be keen of sight to observe the good and bad points, and the causes by which they have been brought about. His judgment must be of the best to suggest remedies for defects, and new methods for bringing out valuable characteristics. “He will prove himself the most successful breeder who can select with the most correct judgment.” Edward Hammond—whose breeding in sheep has been so successful, once said, when asked what pro-

Fig. 2.—FLOOR PLAN OF BARN, CATTLE STABLES, ETC.

portion of the rams bred by himself he would willingly use in his own flock, answered, “Not one in three hundred.” This is but an instance of the care, skill, judgment, and, we may add, present sacrifice exercised by the true breeder. We have said that in profitable breeding the selection must be for a distinct and well defined purpose. The first principle in stock breeding was the selection of animals adapted to the circumstances of the given farm, its size, quality of food, etc. The ancients knew that the breeds of animals that had lived for a long period of time on hard fare and a poor soil, would do better on moderate land than

those that had the highest kinds of keeping. Animals are much like plants, as they do not thrive well if transplanted from a rich to a poor soil.

### How Grain-in-Bulk is Handled.

The enormous and ungainly structures which, to the number of six or more, disfigure our harbor and remind one of Chicago or some other Western grain mart, as one after another they have gone up

weighing the grain and distributing it into the different bins. This will be hereafter described.

#### Receiving the Grain.

The grain cars, in which the grain comes from the West, enter the building on double tracks. The cars are placed over grated openings in the floor, between the track and a little to one side. The cars contain about 600 bushels each, and are filled about half full. When in position one door of the car is opened and some of the grain flows

out. Then two men appear, each having a broad shovel nearly square, perhaps 3 feet wide by 2½ feet high — having one edge and the sides and top furnished with guards. A rope is attached to each shovel by short chains, and the men spring into the car with their shovels. Motion is given to the rope at once, and with the shovel attached, guided by the man in charge of it, is drawn alternately towards

the door of the car, moving perhaps 20 bushels out of the car at each motion. The men have lively work for a short time, and in about eight minutes the car is empty. This operation is shown in figure 2. Meanwhile the grain has passed into a great hopper beneath the track, and has been steadily rising to the very top of the building, by means of a common contrivance of metal buckets upon a band, shown in part in fig. 2, known in grist-mills as an Elevator, but in these grain "elevators" called a "leg." This name no doubt comes from the floating "elevators," in which the grain is raised by band elevators contained in wooden trunks upon the outside, which look a little like great bracing legs. There are twenty of these "legs" in the building, and it is through them that all the grain is elevated to the top, there to be weighed, screened if necessary, and distributed into the various bins throughout the building.

The system by which the grain is distributed to the different bins is very simple. It requires constant vigilance on the part of the weighers, who have the whole of this department in charge, and who have an enormous blackboard, marked off in squares, and numbered to represent each bin, whereon they keep a record of exactly what kind of grain each one contains, and of the quantity.

#### Cleaning the Grain.

When grain—wheat for example—is to be cleaned, it is of course at the owner's expense, and may be done more or less thoroughly or "hard." It is carried up to the screen by a "leg," and discharged into it. On entering the grain is spread out into a thin fan-like stream which falls upon a perforated metal table, the grain in its fall being subjected to a strong stream of air which is *sucked* through it by a "blower." This draft of air is sufficient to carry up, not only the dust and dirt, straw, etc., but light grains and oats, and if applied with sufficient power will even carry up the wheat itself. The best of the grain falls through upon the perforated table or screen, which is subjected to a rapid shaking motion, like the screens of a common fan-mill. The wheat passes through the screen, the kernels of corn, sticks, nails, jack-knives, nuts, bolts, silver quarters, and such things, remain, and are shaken off at the tail of the screen.

#### Weighing the Grain.

The grain is weighed when screened and when shipped. The scales are as high up as they can conveniently be placed. The tops of the "legs,"

and the cleaners are higher, then comes the weighing floor, below this the system of spouts for conducting the grain to the different bins. The scales are capable of weighing a car load at a time, in fact more, but they are not usually more heavily taxed. A weighing is called a "draft," and the "drafts," for convenience of figuring, are of 500 bushels, which, of wheat, is 30,000 pounds, 23,000 of corn or rye, and 16,000 of oats. The grain is delivered by a "leg" into the great hopper-shaped "scale-pan" so to speak, which is so nicely adjusted as to tip the beam as accurately as any grocer's scale. A pane of glass in the side of the hopper-shaped grain holder shows whether it is full or empty, and there is an opening for sampling each "draft," as the grain is received, when that is desirable.

#### Shipping the Grain.

When grain is to be shipped, the steamer or sailing vessel may come along side the "elevator," and the grain may be discharged directly into her as fast as weighed. This, however, is not now the usual way. The grain is first run into canal boats, for the steamers will not leave their own berths, and at the same time that they are receiving grain, other freight may be taken on board at the docks. The loading of a canal boat is seen in figure 3, and four shutles are directed into the hatchways, and a boat is filled in about 35 minutes when three "legs" are used. A canal boat will hold about 8,000 bushels, 480,000 pounds, which is 240 tons or something over 13 car loads. This work goes on so rapidly, that when done as fast as possible, the canal boats can be filled quicker than they can be put in place and taken away from the side of the elevator.

#### Motive Power.

This whole machinery is moved by two lines of shafting in the upper part, which are run by two very plain, but excellent smooth-running and econ-

Fig. 1.—A SIDE VIEW OF THE ERIE GRAIN "ELEVATOR."

near the termini of the great railroads, have excited much curiosity among our own citizens, and of course are objects of interest and wonder to strangers. Figure 1, is a view of one of the most conspicuous of these "Elevators," for so they are called, though they might be called Store Houses with greater propriety. This one was built for the Erie Railway Co., and is calculated to hold a million and a half bushels of grain. This amount is, however, considerably in excess of its actual working capacity. This structure stands upon piles driven to the depth of 60 feet into the mud in what was called Harsimus Cove, between the terminus of the Erie Railway (Pavonia Ferry) on the north, and that of the Pennsylvania Railroad at Jersey City proper, on the south. The piles were sawed off below low-water mark, a flooring of heavy timber placed upon them and bolted fast, and the granite piers upon which the building stands, placed upon this flooring. So long as this wooden foundation remains beneath the water, it will remain sound; The main part of the building, all that from the piers to the first roof, is of wood, and is wholly occupied by grain bins. In the construction of these bins 2 by 6-inch yellow pine plank were used;

Fig. 2.—UNLOADING THE GRAIN CARS.

2 by 12-inch plank being used for the outside course all around. These planks are all laid flat and pinned together. Of course they break joints throughout, and the whole structure is as solid and substantial as it is easy to imagine. The upper portion of the building is occupied by arrangements for

Fig. 3.—LOADING THE CANAL BOATS.

omical vertical beam engines, of 500 horse power each, and exact duplicates of one another. Each one is capable of doing the whole work, and they are run alternately a week or so at a time. The shafting is connected with the engines by long belts of rubber, about 40 inches wide, and each engine runs independently its own line of shafting.

#### General Management.

The receiving scales, at the time of our visit, were those along the south side, and the shipping scales on the opposite side. These two sets of scales being exact duplicates, may change work.

The "Elevator" is or may be run day and night, and in order to do night work, gas is carried all over the building where work is done. This night work must cause a greater danger from fire, than would otherwise occur. There is always some danger, where there is heavy machinery, more or less liable to friction where it is inaccessible, and when the materials are so very inflammable. To offset this, a pumping engine is kept constantly at work throwing water into a tank in the highest part of the "Elevator." From this there is a constant flow, small indeed, but large enough to indicate to the engineer that everything is all right. If this outflow ceases, he immediately puts on more power and pumps more water according to the demand. The water is distributed along the principal floors, and hose are kept attached ready for instant use.

### Some Items in Farm Economy.

The arrangement of the buildings and the division of the farm into fields depends so much upon the character of the farm, the kind of farming, individual taste, etc., that it is out of the question to have a fixed plan that is the best one for all farms of any given size. There are certain general

Fig. 1.—METHOD OF TYING A PIG.

principles which should serve as a foundation for the arrangement, but the details must necessarily vary greatly. For example, if possible the barns should be upon a rise of ground where a cellar can be built opening to the lower ground at the rear. The fields should be so arranged that there shall be as little fencing as possible, and so located that all the fields can be easily reached from the lane. A long field has considerable advantage over one of the same area that is square—in the longer "bouts," and therefore less time spent in turning, plowing, harrowing, sowing, harvesting, etc. A pasture close to the stables is always handy, and other things being equal, the orchard should not be put at the rear of the farm, where the woodlot had best be located. There is much labor to be saved in having every thing so placed—and this applies to the various details that seem trivial at first sight—that there will be no extra steps or turns in doing the every-day work of the farm. For example, many days' work can be saved by having the pump in a handy corner of the barn-yard, where the stock from a number of yards may come to the troughs. If the matters of the farm are not already economically arranged, it would be well to make such charges of fences, buildings, etc., as to finally secure the desired end. By degrees the thoughtful farmer will improve his farm until it approximates to a model and therefore an economical farm.

### The New York Agricultural Experiment Station.

The Legislature of the State of New York, at its last session, chartered "an Institution to be known as the New York Agricultural Experiment Station," for the purpose of "promoting" Agriculture in its

Fig. 2.—A HANDY CORN SHELLER.

various branches. Its management will be entrusted to a Board, and this Board is to be selected by one member being appointed by prominent Agricultural and Horticultural Societies and Clubs, to the number of seven, specified by name—two others to be appointed by the Board itself, and when the

dairy interests of the State shall be represented by one Society, then, it may appoint one member. The Governor of the State and the Director of the Station are *ex-officio* members of the Board. The law provides for filling vacancies, for the officers, for meetings, etc., defines the powers of the Director and of the Board, and appropriates \$20,000 for two years—as we understand it, \$40,000 in all, for carrying out the objects—at least, for making a beginning.

There are several provisions in this act which seem to indicate that this Institution, intended as it obviously is for the good of the whole State, ought not to be so centralized as it would be were the money to be expended in securing land, fitting up experiment fields, stables, dairy rooms, etc., a chemical laboratory and rooms for scientific men to do their work. At the end of two years the results would be very meagre, and we can hardly doubt that a renewal of the appropriation, or, indeed, any appropriation, would be secured with difficulty.

The fact is, there are now within the State several "experiment stations," so to speak, already under way. There is one at Cornell University; and there are private farms where accurate experiments have been conducted, or where preparation is being carefully made for this purpose. We hesitate not to say that there are competent men, gentlemen of wealth, education, and responsibility, in every section of the State who would gladly undertake to conduct series of experiments under the inspection and direction of the Director of the Experiment Station. Furthermore—every large cheese factory, every large butter dairy, and every considerable nursery are experiment stations, ready furnished and manned to do the bidding of the Experiment Station, if approached in the right way, and given credit for their work. So that a little money spent for the actual outlay in case expensive experiments

Fig. 3.—A NORTH CAROLINA SWINGING GATE WITHOUT HINGES.

are made, would be the only cost that would be incurred in this sort of experimental work.

### Hints and Helps for Farmers.

**TYING A PIG.**—"J. K.," Coffeyville, Kansas, writes: "In the Nov. *American Agriculturist*, 1879, in the illustration of tying a pig, the rope is right, only it should come underneath the pig instead of along the back as shown in fig. 1. The rope from the neck passing through between the fore legs and then around the body. Take one rope out on each side of the pig, and stand behind the animal with the ropes in your hands. This way of handling a pig is much more valuable than it might at first appear. Nor is it so cruel as tying by the feet or the snout. Try it on your dog with a small rope, and you will soon learn its method, security and convenience. I often use this method of tying a pig."

**A HANDY CORN SHELLER** may be made from a piece of plank two feet long, two inches thick, and ten inches wide. Drive eight-penny nails pretty thickly into the central portion, just so that they will not come through, and for a distance of ten or twelve inches along the surface of the plank. A small strip should be tacked across the upper end and on the under side to hold on to the top of a box when in use. The corn is shelled by rubbing the ears upon the heads of the nails, the board resting in a slanting position in the box, as shown in fig. 2. We are indebted to a subscriber for this device, whose initials, even, we fail to find upon the letter which accompanied the sketch.

**A GATE WITHOUT HINGES.**—"One of the readers of the *American Agriculturist*," Charleston, S.

C., sends the drawing of "a gate which is in use in Western North Carolina." It consists of a long pole which rests near its middle upon the end of one of the posts, with the gate portion framed into the part of the pole which extends between the posts when the gate is closed. The construction of this pivot-gate is better understood from the accompanying engraving, fig. 3, than any verbal description that can be given. It is quickly and cheaply made, and opens and closes with ease.

**CANDLING EGGS.**—Many of our western merchants employ a box for testing their eggs, like the

Fig. 4.—AN EGG TESTER.

one shown in the accompanying engraving, fig. 4. It is constructed of an empty plug tobacco caddy, with two holes for the eggs. A hole is made in the top, through which projects the chimney of a common kerosene lamp, and the box is also provided with a suitable door on the back to insert the lamp. The egg-tester is set on the edge of a box or table of convenient height. By using both hands, an egg in each, a gross can be tested about as fast as one can count. The work should be done in a dark cellar, or darkened room, a place being provided for each grade of eggs, which may be known as clear, cracked, specked, and worthless. J. L. T.

**SPLITTING WOOD.**—Seeing a boy trying his best to split a section of wood, which would not yield to his axe, I showed him an old method, by which he readily split it. He struck "fair and square" many times in the same place, but did not twist his helve at the moment of striking the wood. The secret of splitting is simply to

"flop" the axe, thus making use of the poll of the axe as a lever the moment it enters. While this method seems to be pretty generally known to the woodsmen of the Central and New England States, the choppers of the West and South, and all old countrymen that have come under my observation, know nothing of it whatever; frequently striking a dozen times, where one well directed blow with a "twist of the wrist" would readily part the stick. I find this motion very effective in splitting our western maple, cedar, balsam, and other tough woods. J. L. T.

Fig. 5.—SPLITTING WOOD.

**Worn-Out Soil.**—The quickest and cheapest way to bring up a soil that is naturally poor or partially exhausted from over cropping, is to get some crop that is a "close feeder,"—one that will take up the scattered food rapidly—to grow upon it.

## Editorial Correspondence.

### Are Large Farmers Desirable?

In conversing with farmers, and others also, as we journey through the country, we hear the frequent expression of a fear that the business of farming will gradually fall into the hands of a few men—those who can employ large capital and machinery, and work at a greater profit and undersell others—and that the competition will “freeze out” the smaller farmers. They point to the example of the Dalrymple, and Grandon, and Watson farms, etc. [See page 422, last month.] There is no cause for fear in this direction. There will doubtless be a number of such capitalist farmers, just as there are a few large merchants. But the fact that there is an A. T. Stewart in New York has not lessened, but rather increased the number of smaller traders. Machinery, system, and wholesale operations in farming are economical under a man of extraordinary executive ability. But the number of persons who can and will carry on such extended operations is very limited, in farming as in trade. The travelling jobbers who supply movable machinery—harvesters, threshers, etc.—place the smaller farmers almost upon a par with the larger ones in respect to implements. The man with a single team can break and harrow his own land, acre for acre, just about as cheaply as it can be done by the man who runs a hundred plows by hired help, and usually more economically. The few great farmers, here and there, such as we described in previous Notes, have been a blessing in that they have been, in one respect, pioneers in showing the possibilities of the soil in certain localities, and called attention to the profitableness of soil culture as compared with other pursuits.

### Working in Gangs.

In our Notes sent for October (p. 422) we referred to the grand sight presented by 16 harvesters working together. On the steamer we met F. Jay Haynes, of Fargo, Dak., returning from a trip to the Upper Missouri, where he had been taking photographs of various interesting points. In looking over his portfolio, we found sketches of gangs of Harrowers and Seeders at the Dalrymple farms, taken by “instant photograph,” which he kindly presented to the *American Agriculturist*, and we forward them herewith. They will give the readers an actual view of these operations as seen on some great farms in Minnesota and Dakota. [Engravings have been made from the photographs forwarded by Mr. Judd, and are presented on this page.—ED.]

### Good Land Still Available in Iowa.

During the last twenty years or more we have so often been into and across Iowa, and watched its rapid development, that we had almost come

to consider this superb agricultural State as “settled up and finished.” But not quite so. Last year we saw sundry good plots still open to purchasers along through the two southern tiers of counties. Yesterday, starting from Running Water, a new village in Dakota, on the Missouri River, opposite the mouth of the Niobrara River, we journeyed by the new branch of the Milwaukee and St. Paul Railroad northeasterly over broad

far into Dakota, though there are here no lands for “homesteading.” There is plenty of such land in Dakota, but one needs the skill to select the really good, and to look well to the water supply. If there is a finer farming country in the world than one can find along the Chicago and N. W. Railroad from Marshalltown eastward, we have yet to see it; and the region northward, as we have just seen it at this writing, scarcely falls behind. But

these older farms in Eastern and Northeastern Iowa, and indeed in many other parts of the State, can to-day hardly be bought, acre for acre, at what ordinary farm land will sell for on the average in the Middle and Eastern States of the Union.

### Prairie du Chien (Dog Prairie).

Some 24 years ago, we visited this town after journeying across Wisconsin, in a tour among the farmers, studying their wants, modes of culture, etc. It was then merely a terminal railway station whence we made our first trip on the Upper Mississippi to St. Paul.—Stopping here now for a night's rest, we have visited the town, or village, (or “city” we believe they call it), which is situated

so far back from the river and R. R. station that those merely passing through do not see it. We found it a flourishing place, with some 4,000 inhabitants, and many fine business and other buildings, located on the bench land below the bluffs. Several large and successful Artesian wells are found here—the water rising from a depth of 800 to 1,000 feet, with sufficient force to supply fountains, to run in pipes to the tops of the houses, and save the need of fire engines, and supply power for manufacturing purposes even. We were most interested in a Linseed-oil Mill, just

started here by Mr. Farnochon, on a small scale, grinding say 25 bushels of flax-seed per day, but to be speedily enlarged. Farmers are receiving about \$1 per bushel for the seed. One bushel yields two gallons of oil, and this is now all sold at the mill for home use—the raw oil for 55 cents a gallon, and a few cents higher when boiled, which just about covers the cost of the seed and waste. But it is a profitable business nevertheless. The “cake” is loaded upon cars, and sent directly through to New York, or other Eastern cities, netting about \$20 per ton. At the East it is fed to farm animals, producing a rich manure, and thus the prairie fertility is carried to and enriches the worn-out Eastern soils.

There are numerous beds of coal throughout Northwestern Iowa, so abundant and easily reached that it is furnished at the railway stations for \$2.50 to \$5.00 a ton, according to its quality and the location. It is a soft variety, and contains a good deal of sulphur usually; but it answers a very good purpose as fuel in stoves adapted to burning it—a most beneficent provision for this prairie region. O. J.

(Other Editorial Correspondence given elsewhere.)

Fig. 1.—A VIEW OF WHOLESALE HARROWING ON THE GREAT WHEAT FARMS OF THE WEST.

prairies now rapidly filling up by settlers. To-day we are passing through the second tier of counties from the northern line of Iowa, and at every Station find quite a number of farmers from the older portions of the West, who have just made new purchases of land, or are prospecting with that object. The crops in most places indicate good land; the prospectors speak well of what they have seen. We are a little surprised to find that there are still several hundred thousand acres of desirable land to be had from the Railroad and others at \$3 to \$6 per acre, with

Fig. 2.—SOWING THE WHEAT ON THE PRAIRIE FARMS OF THE NORTH-WEST.

large reductions in prices to those who buy of the railroad and immediately put it under cultivation—amounting to \$2 to \$2.50 per acre. Considerable plots are held by capitalists and others in nearly all the north-northwestern counties. The larger portions of the railroad lands are in Clay, Palo Alto, Kossuth, and Emmett Counties. We should judge it preferable to examine the available lands in Northwestern Iowa, before going

### A Few Showy Summer Perennials.

Among the more showy plants for late summer and autumn blooming, we find the choicer varieties of Perennial Phloxes, which in their endless variety form a beautiful and attractive sight. Solidagos, or Golden Rods, especially *S. Shortii*, *S. Riddellii* and *S. Ohioensis*, all natives of the Western States; *S. rigida* and *S. stricta*, from the Eastern; and *S. angustifolia* from the Southern States, are among the most showy, and where the space is large enough to grow these tall plants, nothing will show to better advantage at this season. Of Clematises, in addi-

the past three months, and bid fair to last until frost withers their tops. The first of these is *Malva Alcea*, or Hollyhock Mallow. Although a very old plant, and well known in collections of hardy perennials in Europe, it is comparatively rare in our American collections of such plants. It is a native of France and Central Europe; grows from two to three feet high, and is profusely covered with large deep rose-colored flowers, two to three inches in diameter. Our plant commenced to flower early in July, and has been one mass of bloom ever since, with an abundance of buds yet to open. From the axil of the lower leaves new stems appear, which

not stand during winter, ought to be selected. Our plant has been in bloom since June, and still (September 15th) shows no lack of buds and flowers, which are constantly appearing. A bed, or border of this Silvery Sage, backed with the Hollyhock Mallow, would make an exceedingly pretty show in the garden during the summer and fall months.

### Watering in Dry Weather.

BY PETER HENDERSON.

A correspondent from Cincinnati says: "The collection of Roses I got from you in May—fifty in

THE HOLLYHOCK MALLOW (*Malva Alcea*).

THE MEALY OR SILVER SAGE (*Salvia farinosa*).

tion to the large and late flowering varieties, we may mention *C. crispa*, a beautiful purple, fragrant-flowered sort; *C. Pitcheri*, with dark brownish-purple flowers; *C. coccinea*, with bright scarlet flowers, all natives of the Southern States; and *C. Davidiana*, *C. tubulosa*, and *C. graveolens*, very desirable species of recent introduction; the two first growing upright, with purple flowers, and the latter a rampant climber, with greenish-yellow flowers, followed by silvery plumy fruit. Besides these there are the brilliant-colored Tritomas, or Red Hot Pokers, *T. Uvaria* and *T. Macouveni*, several species of *Liatris*, or Blazing Star, notably *L. pycnostachya*, *L. elegans*, *L. scariosa* and *L. punctata*, all fine purple-flowered plants; and last, but not least, the choicer species and varieties of Delphiniums or Larkspurs, but little grown, as yet, in America. The above sorts, with many more equally desirable late-blooming plants, will serve to make a garden attractive during the early autumn, when there is generally a lack of flowers in the garden.

Frequently we are asked to recommend Hardy Perennials for summer flowering, which will give a constant bloom during the summer months. It is a somewhat difficult matter to do this, especially where there are so many that are showy and desirable. We have been highly pleased this summer with two species which have been in full bloom for

in turn produce flowers, so that it makes a constant and profuse bloom. In selecting a spot for planting, choose a sunny place in rich soil, where the plant can have a space at least two feet square. It may be readily propagated from seeds sown early in April in window boxes, or in the open ground in May. The other plant shown on this page is the Mealy, or Silvery Sage (*Salvia farinosa*). It is a native of Texas, and of quite recent introduction into cultivation. Although the genus *Salvia* contains many fine and strong species, natives of different portions of the United States, but few of them are known to cultivation; and most of these are introduced through seeds or plants from English nurseries. This species of Sage grows in large tufts three to four feet broad, and two feet or more high. The individual flower stems are four to six inches long, and are covered with beautiful violet-blue flowers, one-half to three-fourths of an inch long. The flower stem, as well as the leaves and calyx, are covered with a soft, silvery-whitish down, which renders the whole plant extremely showy, even when not in bloom. It has proved perfectly hardy during the past winter in the vicinity of New York City without any protection whatever. Until it becomes more plenty, however, it would be well to keep a plant in a cool greenhouse, or even in a cold frame. A rich, sandy soil, where water does

number—are getting 'smaller by degrees and beautifully less.' We have hardly had rain for a month, and the thermometer up among the nineties. I sprinkle them every night, but it seems to do no good. What can I do? Let me know through the columns of the *American Agriculturist*, as I suppose my case is a general one, and will interest others."

Stop the "sprinkling," and give each plant a horse-bucketful once a week in dry weather until they begin to grow, being careful to make a tight basin around the plant, so that the water does not run off. When the water has soaked in, the edges of the basin should be raked level for the double purpose of preventing the soil cracking where the water has run, and making a loose surface. If watering is thoroughly done in this way once or twice, it is likely all that will be necessary, for as soon as a plant of any kind begins to make roots—which is indicated by its making a fresh top growth—there is little or no necessity of its being further watered in the open ground if the soil is of average quality. In our own practice we never think of watering plants set in the open ground, unless in cases where late planting is necessary, and then they are individually watered by the bucketful as above, which is rarely done but once. Much labor that can ill be afforded is entirely thrown away in this "sprinkling" of plants. I have seen

market gardeners dragging for weary hours in mid-summer along their long rows of celery, sprinkling with rose watering pots, repeating the process day after day—and yet the whole crop failed. If watering is ever to be done at all, it must be done copiously—it is far better to put on all the force a whole day once a week, and do the watering in a thorough manner, than to give a “sprinkling” with the same force an hour or two every day.

### Our Blackberries: The Snyder.

Of over one hundred and fifty known species of the genus *Rubus*, only two, *R. villosus*, and *R. Canadensis*, furnish us the really good varieties of our cultivated Blackberries. *Rubus fruticosus*, a widely known species in Europe, is not the source of any very valuable cultivated varieties; in fact no successful efforts have been made to greatly improve the wild European species. In many parts of our own country the people are satisfied with the fruit furnished by the “brambles” of the fence rows, fields, and wood lots—and it is of such a good quality, and often not lacking in quantity—that the garden culture of the blackberry is thereby retarded. The varieties that now take the lead have been chance seedlings, found growing wild and removed to the garden where they have received careful attention. Thus the Lawton was observed on a roadside in the town of New Rochelle, Westchester Co., N. Y. This variety, called New Rochelle, and better known as Lawton, has done more to introduce the blackberry to cultivation than all the other sorts put together. The liability of the canes to winter-kill, and the unpleasantness of the fruit unless perfectly ripe, has placed the Lawton

world than if he had opened a gold mine.” The fruit is large, and when ripe, rich and melting. The plant is a vigorous grower, and with good soil and culture is very productive. The Snyder blackberry originated on or near the farm of Mr. Snyder, near La Porte, Ind., about the year 1851. Like the two above mentioned, it is a chance seedling of the *Rubus villosus*, or High Blackberry of the fields and hillsides. The accompanying engraving was made from a photograph of a portion of a fruiting cane nearly ten feet in height, brought to our office by E. P. Roe, Cornwall-on-the-Hudson, N. Y. We visited Mr. Roe's small fruit farm and nurseries about three weeks before the Snyder ripened its berries, and were both surprised and pleased at his field of this blackberry. The Snyder is wonderfully productive, as a small portion of one of the fruiting canes, much reduced in size in the engraving, would indicate. The plants are very vigorous and stocky, and ripen their fruit quite early. The great desideratum among blackberries has been one that is perfectly hardy, and this want has been met in great part by the Snyder, which endures without any serious injury the extremes

of temperature of the Northern States. The great fault of the Snyder is the size of the berry, which is somewhat below the Kittatinny and Lawton. On this point Mr. Roe says, in his “Success with Small Fruits”: “On moist land, with judicious pruning, it could be made to approach them very nearly, however, while its earliness, hardness, fine flavor, and ability to grow and yield abundantly almost anywhere, will tend to an increased popularity. For home use, size is not so important as flavor and certainty of a crop. It is also more nearly ripe when first black, than any other kind that I have seen, its thorns are straight and therefore less vicious. I find that it is growing steadily in popular favor; and when the Kittatinny is winter-killed this hardy new variety leaves little cause for repining.”

#### The Fall of the Leaf. —

During the growing season the leaf is the seat of great chemical activity. In the green tissue, which is spread out to the light and air, the crude materials, which come from the soil and the atmosphere, are transformed into new compounds, and then go to build up the various parts of the growing plant. As the season draws to a close, the

work of the leaf also comes to an end; and in decay it often assumes gorgeous colors and finally falls to the ground. At first thought it might seem that in the annual production of leaves there

is a great waste. Leaves should be on the outmost branches to be in the sunshine; they must therefore appear on the new growth, that is, come in the spring and go in autumn. Leaves in one sea-

ST. DABEOC'S HEATH (*Menziesia polifolia*).

son get choked up with the residue material of assimilation and become inactive should they remain. And last of all, the most expensive part of the leaf—the *protoplasm*, the substance in which vital changes take place—is to a very large extent withdrawn by the tree, and is not lost, it passing out of the leaf and into the stem below, before the leaf separates from the stem. In the fall of the leaf in autumn there is a gain in many ways instead of a loss.

### A Rare Shrub—St. Dabeoc's Heath.

Among the smaller shrubs which have been under cultivation in our grounds the past few years, is the *Menziesia* (*Dabeocia*) *polifolia*, or St. Dabeoc's Heath. It is a native of France, and is also found sparingly in Ireland. The flowers are of a beautiful pink, bell-shaped (nearly half an inch long), and drooping, as shown in the accompanying engraving. This pretty little Heath commences flowering in July and remains in bloom until after the middle of September. There are a number of varieties of this species found in Europe, the white one being the only one we have seen. They make very pretty shrubs for herbaceous borders, or for planting among other dwarf-growing plants. So eager are many American planters for rapid, vigorous-growing shrubs and plants, that they entirely overlook these little gems, which require some extra care in growing. There are numerous species of Ericas, or Heaths, found abundantly in various portions of Europe, which do very finely here in our borders, but are rarely if ever seen in gardens. The number of rare and little-known Ericaceous plants found in our own country is by no means small. The common Heather, or Ling, of Europe is perfectly hardy in the United States, and can be grown easily if a little care is taken at the start. *Epigaea repens*, or Mayflower, is easily grown if attention is only paid to getting good plants with good roots. They should be taken up in October and potted in good leaf mould and sand, and placed in a cold frame or cool greenhouse, where they can form new roots,

A BRANCH OF THE SNYDER BLACKBERRY (MUCH REDUCED).

at a great disadvantage with the Kittatinny, “whose Indian name has become a household word from association with this most delicious fruit. Mr. Wolverton, in finding it, has done more for the

and by spring are fit to plant out. We should be glad to see more attention paid to these small shrubs by our planters and lovers of choice flowers, for we know that no class of plants are more desirable where the space that can be devoted to them is small. A sandy soil, well mixed with leaf mould, is suitable for growing this class of plants, though it is found that the Ling, Trailing Arbutus, and the early-flowering *Erica carnea* do well in sandy soil without leaf mould. We have often heard it said that our climate is not suited to growing such plants, but from an experience of some years with them, we see not the slightest difficulty if proper care is given at the start. A bed of these *Ericaceous* plants in our grounds is a constant source of pleasure during the whole season, as there is scarcely a week during the summer that some varieties of *Erica*, *Andromeda*, or *Menziesia* are not in bloom.

### The Importance of a Farm Vineyard.

The great increase in grape culture is encouraging. California has thousands of acres in vineyard, and nearly all the European varieties of grapes are produced in the greatest perfection and abundance. Extensive vineyards have been planted in the Ohio and Missouri Valleys and in favored localities in the Northeastern States. New varieties have been originated and widely distributed, that are hardly enough to mature in every State in the Union. Our large cities and many of our villages along the line of railroads are fairly supplied with good grapes in their season at reasonable prices. It has been demonstrated that every farmer and villager in the land can have an abundant supply of this delicious fruit for four months in the year, for the trouble of planting and caring for a few vines. Our horticulturists have done the pioneer work of hybridizing, and originating new varieties that stand the test of soil and climate in all the States. And yet California is the only State where the grape may be said to be fairly popularized. The great mass of our farming population do not enjoy this luxury, and multitudes a little remote from market towns are only acquainted with our wild varieties. The grape ought to be as widely disseminated as the apple, and there is no good reason why it should not be. The large vineyards can supply our city population, but to supply the agricultural districts, grapes must be grown at home. This can be done, at so small cost, that no man who owns a home with a half acre of land has any apology for depriving his family of grapes. An eighth of an acre in vines will supply a family and leave a surplus to sell. Any well-drained land that will produce sixty bushels of corn to the acre may be expected to produce good grapes. Well-prepared borders, with a good supply of bones, are desirable, but by no means essential. A dressing of wood ashes is an excellent fertilizer, but any manure good for corn will be good for the vines. The varieties which do well under the greatest variety of circumstances, and bear neglect best, are such as the Concord, the Hartford Prolific, and the Ives Seedling. There are grapes of much better quality than these, but they are good enough to suit the popular taste, and are hardy. They can be relied upon to bear fruit every season in generous quantity. The Ives has a thick skin and is particularly desirable to pack in boxes for winter use. They have been for years before the public, are thoroughly tested, and can be furnished very cheaply by any nurseryman. A cheap trellis of chestnut posts and wire will be all the support they need. A four-months' supply of grapes will promote health in the family, save doctors' bills, and prove an important part of the food supply. W. C.

[Feeling the importance of the grape vine upon the farm, we gave, in 1878, a series of articles headed "One Grape Vine," in which directions for planting, etc., were presented at considerable length. These articles, judging from the many letters they called forth, met the wants of a large class. The matter of pruning the vine was thoroughly explained with illustrations in the April number of the present year, to which the interested reader should turn for hints on this important part of the work of the farm vineyard.—ED.]

### The Corn Smut (*Ustilago maydis*.)

The Smut in Indian corn, which has long been an annoyance to farmers, is a fungus, and therefore a minute parasitic plant, which, instead of growing from the soil and elaborating its own food, vegetates in the growing tissue of the corn plant, and robs it of its nourishment. It is difficult for any one to tell,

Fig. 1.—A BADLY SMUTTED EAR.

owing to its minuteness, just when and where the smut plant begins its growth upon the corn—it may be that the spores, or seeds, of the parasite are clinging to the grains of corn and are planted with them. As the moving air is known to be constantly carrying invisible fungus germs from one place to another, it is more probable that they first reach the corn plant in this way, and enter it by germinating upon the surface and sending the young threads into the substance of the stem and leaves.

Fig. 2.—PORTION OF SMUTTED TASSEL.

After growing for a time, the parasite prepares for the production of a new crop of spores, by means of which the smut plant is perpetuated. This it does by first accumulating a mass of threads in certain favorite portions of the plant, usually the young grains of growing corn. At first the affected grains are noticed of unusual size, followed shortly by a darkening of the interior, together with a constant increase in size, until at last the grain has assumed large dimensions, is soft throughout, and made up almost entirely of a sticky mass of black spores. Figure 1 shows an ear, the grains of which have been thus transformed by the infesting smut plant. On account of the ears of corn being covered with husks, the early stages of the smut are not seen, and the first that is observed is the black, worthless mass that is the final stage of the parasite. In fig. 3 an ear is shown in which but a few scattered grains are smutted, and the difference in their size and shape is strikingly contrasted with the normal ones

around them. The production of spores is not entirely confined to the grains, but they frequently make their appearance in the male flowers situated at the top of the stalk, and composing what is commonly known as the tassel. A portion of a tassel thus affected is shown in fig. 2. A few of the small, dark-brown spores, which make up the mass of smut, are shown in fig. 4, and are magnified about five hundred times. The number of spores that a single smutted ear will produce is almost beyond computation. Corn Smut is injurious to animals if eaten by them to any considerable extent; it acts both as a poison and mechanical irritant. Moist seasons are peculiarly favorable to the development of the Smut plant—therefore it is much more common one season than another. If the Smut plant enters the growing corn through the seed with which it has been planted, a treatment like that used for seed wheat to prevent Rust may be of value in preventing its occurrence. This is to wet the corn before sowing with a solution of Sulphate of Copper (blue vitriol), and dry it with lime. The best way to rid a field of this pest is to pass through it as soon as the smutted ears appear and gather and burn them.

Fig. 3.—PARTLY SMUTTED EAR.

This both keeps the smut from the live stock and prevents it from shedding broadcast the millions of spores. Other kinds of grains are infested by fungi and have their shape and properties changed even more than in case of the corn. Thus the Ergot or "Spurred Rye" is the grain of the rye greatly distorted by the growth of the parasitic fungus, producing a much more poisonous substance than the common corn smut.

Fig. 4.

### Handy Home-Made Garden Tools.

BY J. L. TOWNSEND.

GARDEN TROWEL.—In but few country places can a gardener's outfit be purchased, and after waiting in vain for our hardware stores to offer garden trowels for sale, my next expedient was to make one. Selecting a piece of an old steel shovel

A GARDEN TROWEL.

blade from the "catch all" of our village blacksmith shop, I soon produced a blade which was supplied with a shank by the blacksmith, while I turned a hard-wood handle for it on my foot lathe.

TRANSPLANTING DIBBLE.—He who keeps a box of odds and ends, will find that many a useful tool can be fashioned from the broken parts of others. Needing a garden dibble, I resorted to my box of iron old and found a shank from a broken hoe. I cut off the small piece of the hoe blade, straightened the shank and pointed it, and inserting a neatly turned wooden handle with a rather large head, I secured for my work a very handy tool.

## THE HOUSEHOLD.

For other Household Items see "Basket" pages.

### Home-Made Picture Frames.

(BY CARRIE CLOVERNOOK.)

"We girls" at home have, as the dealers say, made a specialty of frames. We took some plain molding that had done duty on an old-fashioned door-casing, had it measured and sawed into shape, and with the help of a single sheet of dark pebbled paper, and one-half sheet of gilt, made a frame that, I think, no one has suspected is not really rosewood and gilt. We have paid homage to the white, short-lived beauty of frames of parched corn, and the long list of odd and rustic devices that we have

seen in print, or been shown us by friends, but none of us had thought it possible that any beauty could be hidden in coarse brown wrapping paper. First, a frame of suitable size and width for the picture selected must be cut from stiff pasteboard, figure 1, taking care to have it perfectly true. An old box-cover will answer the purpose very well. If you have never seen brown paper well

varnished, it may be best to select several bits of different color and texture, and apply two good coats of varnish, then you can easily decide which should be used for the frame; that of medium thickness and stiffness is best. Cut out squares, of three-fourths of an inch in size, figure 2, fold with the fingers, first from corner to corner, then double again upon the remaining corner, making a triangle of four thicknesses of paper, figure 3. Sew these small triangles on the outer edge of the frame, and also on the inner, letting the points reach out beyond the edge, and also overlap so that the middle of the base of the first will be touched by the lower point of its next neighbor. Continue to sew rows on the frame from each edge until the bases of the triangles meet in the middle of the frame, remembering to have the outer

Fig. 2.—METHOD OF FOLDING THE PAPER.

row fall over the opening between the points of the first row. When the frame is filled, if its sides are straight, a narrow strip of paper, with edges folded in—laid over the bases—will finish it neatly as shown in figure 4. I ought to have mentioned at first that loops of strong tape should be sewed on the back for convenience in hanging, which can best be done before the front of the frame is made. If the frame is oval in shape, a strip would not lie smoothly; and squares, like the first used, but folded to retain their first shape, one-fourth the size when finished, are laid on over the bases, overlapping each other. Some may think them prettier for any shape of frame, than the strip. When well varnished it is completed. Thin soft corn husks can be used in the place of paper, in their natural color or dyed.

Fig. 3.

Another style of paper frame, which I like better than the first, is made by cutting strips of paper, one inch wide, and one-half inch longer than twice the width of the frame measured in an exact diagonal. Fold the whole strip so as to halve the width, find the middle in length, fold a point in such a way that the equal arms shall be sides of a right angle, as shown in figure 5. When enough of the pieces are prepared, they will be managed more

easily by commencing the frame half way down the side. Sew the first by the point a little over the outer edge of the frame; fasten the second so that the arms shall be parallel with the first, that which lies on one side should have the arm placed under that of the first, that on the other side should be over the other arm of the first, as shown in fig. 6. When all are sewed on—interlaced like basketwork—fasten the ends on the inner edge of the frame,

Fig. 4.—PORTION OF FRAME.

trim evenly, and finish by a narrow strip of the same or of gilt when the frame is dry, from varnishing. The corners of the frame will be improved by a rosette of points to hide the irregularity. Figure 7 shows such a frame complete. If oval, the basket-work can easily be carried around the frame, but some other finishing will be needed for the inner edge—an oval of gilt paper cut in tiny points is as pretty as anything I can suggest. If preferred, half the strips can be of light paper, the others dark, when

5.—THE PAPER FOLDED.

interlaced they will look well, but I prefer the dark, that, when finished, is almost the color of rosewood.

### Home Topics.

BY FAITH ROCHESTER.

#### A Fashion Note.

I don't pay much attention to the fashions. There is such a variety of patterns, both old and new, the old coming new again, "as round and round we run," that no woman can tell what is the "very latest style," unless she "gives her mind to it" to a degrading extent. Amid the conflicting reports I hear at last one announcement that gives me pleasure: "*Simplicity is elegance now!*" Indeed! When was elegance anything else? Here we are all bunched and upholstered and tied back, with ruffles and shirrs, and pleatings, and pipings, all over us, in dutiful obedience to Fashion's behests, and now—"simplicity is elegance!" Here are our best silks and satins all cut up and shirred, and plaited according to directions, and it is no easy matter when the eye is wearied, and the taste nauseated with fussiness upon fussiness, to get rid of our ruffles and platings, and straighten and press out the slashed and shirred goods—into elegant simplicity.

I knew it would come to this—though after all I doubt whether it has really come; an era of simplicity in dress, a little rest from the long reign of "fuss and feathers." It cannot have come to stay, for woman is not yet sufficiently educated to understand the reason and use of clothing, and the first principles of beauty and art. The earliest, or barbaric, idea of dress was mere ornamentation—paint and feathers, and tinsel; and woman has not outgrown it. Thousands of women individually know

Fig. 6.—PORTION OF FRAME.

and keenly feel how disgraceful and degrading this is, and they wear clothes which they emphatically condemn as uncomfortable, inconvenient, and ugly. They conform to the changing fashions, avoiding the most glaring outrages, because singularity in dress, without great wealth or beauty to back it, is social martyrdom, affecting not their own happiness

alone, but the comfort of their friends. Few of us are as independent, in this respect, as we might be. Most of us could wear fewer ruffles and furbelows, without any loss of self-respect, or of the esteem of the community at large. We might all help to create the public opinion, that good comfortable and serviceable fabrics are more important than pretty trimmings, and that comfort and convenience of clothing are essential to genuine beauty and grace.

#### A Fashion for Mothers to Keep.

The warm, colored, outside drawers for little girls ought not to be given up. Many still wear them, but I think they are less common than they were a few years ago. Woolen under-drawers reaching to the ankles are necessary for girls and women in winter. These being the real "under-clothing," it is hardly reasonable to put white cotton drawers over them—the same as are worn next the body in summer. For warmth and protection, strong, colored, woolen cloth is the best that can be found. Being an outer garment in reality it seldom needs washing, and to most mothers this is a recommendation. Fastened with a band below the knee, the dress skirt will usually conceal the drawers, and when exposed there is no sacrifice of modesty. It is such a serious task to keep the long merino stockings darned on the knees, that I think we do well to encourage a style of dressing the lower limbs, that relieves us from this needless labor. The banded drawers, being loose over the knee, are not so easily worn through, and are more easily mended. Please, fashion makers, consider well these very important things for the sake of all poor and overworked mothers and their children. Make the fashions graceful and pretty, and teach us by precept and pattern that "simplicity is elegance!" Let us, who have the fashions to follow, hold fast that which is good—among other things, the colored winter drawers for our children.

#### Childrens' Brains.

I have been looking over, with interest, one of the series of American Health Primers, on "Brain Work and Overwork." One thing that interested me was, what I found incidentally about the nourishing of childrens' brains. It has long

Fig. 7.—THE FRAME COMPLETE.

seemed to me that children are often stunted and defrauded mentally by their unhealthy ways of living. Pure air, good food, and drink, plenty of sleep and recreation, and healthy modes of mental activity, are all essential to the proper growth and development of the brain. It is sometimes the case that the child's food contains too little nourishment to supply the needs of both body and brain, and one or the other is enfeebled as the result of this deficiency. Sometimes the food supplied taxes the digestive organs so greatly as to make mental labor almost impossible, and the child is dull and slow to learn. This may be one result of munching confectionary and indulging in rich cake and pastry. I know of children who are habitually fed with rich food and confectionary, but who have such good constitutions and so active an out-door life in pure air that they contrive to grow and keep from actual sickness most of the time; but when they go to school they make very little progress, and are a constant trial to their teachers. When I hear

about this from the teachers, or know of the severe sicknesses that sometimes cause their removal from school, I always wish I could change their diet. If to this lack of good nourishment be added, as is often the case, habitual exposure to cold during cold weather, from lack of sufficient clothing, the case is still worse for the growing brain, as well as for the growing body. Vitality, which should be spent upon growth and repair, is unduly drawn upon to keep up the necessary warmth of the body. When the surface of the body is not kept at a proper temperature either by the atmosphere or by warm clothing, or by both, the circulation of the blood is disturbed, and nervous force or vitality is drawn from some internal organs, which are weakened thereby, and perhaps become permanently diseased in consequence. It seems to me a great piece of cruelty to send children to school poorly fed and insufficiently clothed, so that the poor body is constantly uneasy in some way and unwilling to give the brain a fair chance to do the work required. To such a child the tasks of school seem hard and distasteful, and if it is forced to do them under such conditions, it is at the expense of the health of both brain and body.

Pure air is absolutely necessary to the best conditions—pure air all of the time, night and day, indoors and out. The blood is the building material of the whole body, brain and all, and this is made of our food, good blood or poor, according to the food and drink we take, and in proportion as it is cleansed by pure air at every breath taken into the lungs. Exercise of any organ is necessary to its best development, but there is more danger, under present educational systems, of over-working the brains of children than of under-working them. Teachers sometimes sneer at this idea. "If you could see," they say, "how lazy the pupils are, how little work it is possible to get from most of them, by our best endeavors, you would see that it is the teachers who are over-worked, instead of the pupils." Yes, I do see, and I most heartily pity the teachers. The children at school seldom do an unreasonable amount of work, provided they were in any fit condition to work at all, which most of them are not. And what can the poor teachers do? Few of them are intelligent enough to know what is the matter, and, to tell the truth, many of the teachers are in the same predicament as the pupils—incapable of doing their best work because of impure air, bad food, stimulating drink, improper clothing, late hours, too little wholesome sleep, and a resulting bad condition of the improperly kept brain.

There is a deal of talk nowadays, on both sides of the ocean, about our systems of education. Every body sees that on the whole children are not educated as we could wish. It is my belief that the parents need exhortation and reproof more than any other class. They must send their children to the school in a much better condition.

#### Keep the Little Folks Healthy,

and nature alone will do the work to a surprising extent. That is to say, she alone will do better work for a healthy child who has a good home than all your educational systems put together can do for a sickly child with poor home influences. Let these healthy children grow up to be healthy teachers and parents, and this muddle about education will clear itself up. Healthy children love to learn. Knowledge is the natural food of the mind, and they crave it. They do not always like to "sit on a bench and say 'A,'" but they want to know about everything, and healthy teachers and parents love to answer the questions they ask. At present it is a common thing for both teachers and pupils to be over-worked, and to have to leave school for a period of brain rest. Sometimes the breakdown is sudden, but the worst cases often come about so gradually as scarcely to seem like breakdowns until the work of exhaustion is so complete as to be almost hopeless. These cases take a long time for recovery, and sometimes entire recovery is impossible. It is a wicked thing for parents to be careless of their children's rights in this respect. When the whole of life is a school, and education is never finished, how foolish to be in haste; for here especially "haste makes waste." A tired brain

should be thoroughly rested by each night's sleep and nourished by each day's food and air. If this is not the case, it becomes gradually impoverished. If this takes place while the brain is still growing, or in youth, the case is very sad. This furnishes a satisfactory explanation to the many cases that we know of early precocity and mature stupidity.

#### Staining the Book-Case.

Our book-case is made of plain pine. When it was made we could not afford glass doors, nor paint, nor varnish. The grain of the pine was very pretty, but it became a serious trouble to keep it clean. Now we have stained it with good success, I think; and next week I think we will add a little varnish. But I am pleased with the staining, and I will tell how it was done. I said I would do it myself, and I looked up a recipe. It said, "use tobacco," but like little Robert Reed,

"I'll never use tobacco, no!"

I haven't a kettle that I could defile by boiling up tobacco in it, so we must have something else. The painter, near, furnished a stain made of burnt umber and some mixing material. I know there was turpentine in it, and I think there was oil. I know there was before we got through with it. It seemed simply a thin paint, and as it covered up the grain of the wood (we tried it first on a pine box); I didn't like it. The painter furnished a fluid (seemingly turpentine) to thin it, but even then it failed to show the pretty grain of the pine. I wet a cloth in kerosene and rubbed off the stain, and lo! I had just what I wanted. We quickly colored our book-case, and it looks as much like black-walnut as any stained wood I ever have seen.

#### A Neat and Easily Made Lamp Mat.

A lady friend favors us with a sample of a paper Lamp Mat, from which the accompanying engravings are made. The construction of this household ornament is very simple. Any kind or quality of thin paper may be used; the one in question is made from an ordinary newspaper, but a more showy mat would doubtless result from using a pleasing shade of paper, or even four well chosen colors—the number of strips in the mat. A single strip is shown in fig. 1, and consists of a piece of paper, nearly a foot in length—this will depend somewhat

Fig. 1. STRIP OF PAPER.

on the size of the mat desired. Each of these strips of paper is folded smoothly so as to be of six or eight thicknesses, and as wide as one half of the required width of the smooth inner portion of the mat. The ends of the

Fig. 2.—THE LAMP MAT COMPLETE.

strip are cut with scissors into uniformly fine shreds, leaving a portion in the center twice as long as wide. The four strips, thus prepared, are then placed together, in the form of a square, one

end above and the other below its neighbors, and stitched in place by a fine thread. In this way the ends of the four strips make an entire border to the mat, consisting of the long fringe of the finely cut ends of the paper as shown in fig. 2. The cutting of the fringes is the hardest part, as it must be done with care that the shreds are straight and uniform in thickness. The whole work can be made in an hour, and with a slight outlay for pretty colored papers, a useful and ornamental mat can be cheaply and quickly provided for the lamp.

#### A Handy, Hanging Match Holder.

Our little match-holder that hangs below the oil chamber of the student lamp, is one of the appreciated conveniences of the household. In fact, we have one for each large lamp, and wherever the lamp goes, and the matches are there ready to be used in lighting it. The latest comer, the neatest, and "the one for the parlor"—we use it for the sitting-room—is made with an egg-shell for the cup and is covered with worsted, and decorated as shown in the accompanying engraving. A wide range for the exercise of taste is allowed in the construction of this little convenience. The cup may be of tin or china, and the covering of Bristol board with initials, or the word MATCHES worked on—but, to our notion, this latter is not called for; in this age and country matches are known by all.

A LAMP MATCH HOLDER.

#### Decorations for Humble Homes.

To such as would gladly make their plain parlors a little more attractive, and whose walls must go unadorned, if they cannot manufacture ornaments themselves, the following hints will be acceptable.

**STATUARY.**—Doubtless some of your readers have old-fashioned Plaster of Paris mantel ornaments that a quarter of a century since were the admiration of all of the members of the family, but which, long ago, stained and faded by time, were consigned to the garret. Some of these may be converted into very pretty "bronzes" by the application of bronze shoe-dressing. Those that are gaudily painted in red, blue, and green cannot be bronzed in this manner, as the color would not be uniform. Of course, none of them will rival Rogers' Statuary in elegance, but to eyes unskilled in such matters, the deception might not be noticed, and very few would ever recognize old friends under such a guise.

**A RUSTIC CORNUCOPIA.**—If you are making a wall-basket as a receptacle for dried grasses, grain heads, etc., do not cover it with wall paper, but try to give it a rustic look in harmony with its contents. Cut a three-cornered piece of card-board; lap two edges and tack them together with needle and thread, making a long horn. Trim the top off with scissors, so that the back is pointed upwards and the front curves downwards three or four inches lower than the back. Cover and line it by pasting on brown wrapping-paper. Then cut strips of the same paper three-fourths of an inch wide, and fold them into what children call "cat-stairs." Tack these closely together around the horn, beginning at the curved top, being careful to preserve the same curve all the way to the point. Gradually cut the strips narrower, as they should not be more than one-fourth of an inch wide, to go on neatly at the point. Finish with a coat of varnish, and have a neat, lasting ornament for your wall. E. K. B.

## BOYS &amp; GIRLS' COLUMNS.

## The Doctor's Talks.

An old negro, it has been said, replied when asked: which is of the most value to man, the sun or the moon? "Why! de moon, cause it shines ob de night!" Like the colored man many of us are apt to forget the value of blessings when they come to us regularly and silently as does the light of day from the sun. The day is day because the great orb of light and heat, situated so far away in

Fig. 1.—AN OVER-SHOT WHEEL.

space, makes it so. And the moon which in its fullness lights up the night does it with rays which are borrowed from the sun. Moonshine is sunshine, and may be explained in much the same way that the mischief-loving boy makes the bright sun to shine in his classmates' eyes across the schoolroom, by means of a small looking

glass or a bright piece of tin. The sun shines on the tin and the light is changed in its course, and can be directed this or that way by turning the tin. In like manner the sun, after it has gone down out of our sight, shines on the great face of the moon, and the rays of light are changed in their course, and some of them fall upon the earth and make the pleasant moonshine or moonlight. The sun then gives us both the light by day, and the light by night. We must not therefore think any the less of the moon, because were it not in the heavens, we should have no pleasant moonlight nights. Besides giving us light and heat the sun does a great many other things; or I should say, because it gives us light and heat it is able to do much for us that may at first sight seem to have no relation to the sunshine.

## THE SUN IS THE SOURCE OF OUR WATER-POWER.

But what is Water-Power? a thousand readers may ask. It is the force exerted by falling or rising water—running water is falling water. You have been told in previous Talks that all hodies fall because acted upon by the force called Gravitation, and from this you might conclude that water-power was due entirely to gravitation. What is water doing or trying to do when it falls? It is trying its best to get to the center of the earth, the center of the action of gravitation, and comes to rest only when it cannot get any nearer that center. But why does not all the water soon come to a state of rest? It is here that the sun comes in, it making the rain to fall and the rivers to run. The warm rays of the sun, shining on sea and land,

Fig. 2.—AN UNDER-SHOT WHEEL FOR RAISING WATER.

silently change the water into vapor and lift it up into the clouds, or rather lift it up and clouds are made out of it, which after a time give up the water, and it falls on hill and plain as rain. The rain fills the spring, away up on the mountain, and feeds the brook as it flows down the valley, turning here a mill, and there a factory, until it, joined by other streams, becomes a river and flows on to the ocean. The sun makes the rivers run, and the running rivers give us much of our best water-power.

## SOME DIFFERENT KINDS OF WATER-WHEELS.

The power that is in falling water is applied to various uses by means of water-wheels, which are turned by the stream, and these wheels turn other wheels in the machinery of the mill or factory, and thus the grain is ground or the cloth made. These water-wheels are of various kinds, and are either those that turn "over and over" or vertical wheels, or horizontal, which turn "round and round." Of the vertical ones there are three kinds, the over-shot the under-shot and the breast-wheel. In the over-shot the stream of water falls into "buckets" at the top of the wheel and acts principally by the weight of the water. An over-shot wheel is shown in fig. 1, where it will be seen that one side of the wheel is made much heavier than the other by the water, and that side is constantly made to go down, when the water flows out, while fresh buckets are filled at the top and the wheel is kept in motion. In the second kind of vertical wheels the stream strikes against the boards or paddles at the bottom, and acts entirely by the force of the current. This kind of water wheel is placed directly in a running stream where the current is swift enough, otherwise a dam, and a "race way" is provided, with sufficient fall to give the required force. In figure 2 is shown an under-shot wheel, used for raising water. The running stream turns the wheel, to which a number of cups or buckets are attached, and are carried up and emptied into a trough as the wheel revolves. In the third kind, the breast-wheel, the water rushes against the side of the wheel, fig. 3, about midway between the top and bottom, and the work is done by a combined force of the flowing water and its weight when falling. The under-shot wheel is the one most commonly

Fig. 3.—A BREAST-WHEEL.

made by children in their play in the little streams in spring time. The over-shot, for the same amount of water flowing, is the most powerful of the three. The horizontal or turbine wheels, those that go "round and round," must be treated at another time.

## SEALS AND THEIR WAYS.

Did many of my young readers ever see any Seals? Yes, doubtless, a good many of you. The showmen sometimes have one in their travelling menagerie; and many of the larger cities, as Philadelphia with its Zoo, and Central Park in New York, have Seals, and their cousins—the Walrus, Sea Lion, etc., on exhibition. A few weeks ago the writer was out in a boat in Boston Bay—"down the Bay"—as they call it at the "Hub," and what did he see but a lot of seals! The first ones that I saw were a considerable distance away, and were upon some low rocks just above the water. With the aid of a spy-glass they could be distinctly seen, and were at play, having a real good time. Those of you who have not seen these strange-looking sea animals, will get a pretty good idea of how they look from the picture here given of one, which is very common in Greenland and the other cold regions of the Arctic Ocean. The common seal, the one I saw, when full grown, is about six feet in length, brownish on the back and yellowish below. The head is much like that of a dog, and the voice also like that of a dog—a sort of a bark. The seal can close his ears and nostrils water-tight, which it does when it dives, and remains under the water for a quarter of an hour or so. The seal has four legs, but they are odd-shaped ones, and not of much good for travelling on land. A seal on land is very awkward. They are easily

tamed, are docile, and can be taught many things, as to sit erect, bow, kiss the hand, shoulder a gun, shake hands (!), turn a hand organ, and many such other amusing things. Seals are very valuable for their skins, also for the oil which they furnish. The Esquimaux live very largely upon the seals, which they catch in great numbers in their cold, northern homes. It is told—and with good reason for believing it—that a fisherman on the coast of France acquired the knack of calling the

the young seals to the side of his fishing boat. "One of them so small and plump in its baby sealskin, and large wondering eyes, tempted him to steal it from its mother, and take it home to his children to raise as a household pet. In course of time the young seal was weaned from the nursing bottle and placed on a diet of young herrings. This seal became greatly attached to all members of the family, particularly the children, and would show

Fig. 4.—A GREENLAND SEAL.

great distress when not allowed to go with them in their boats. He always accompanied his master when tending the herring weirs, either swimming alongside the boat, or sitting upright on one of the seats. It would lie for hours stretched out under the kitchen stove. On warm sunny days it would swim off to the neighboring ledges of rocks, and mix with its friendly relatives, returning at evening to have a romp with the children in the water."

## Our Puzzle-Box.

## NUMERICAL ENIGMAS.

1. I am composed of 28 letters:  
My 5, 18, 16, 11, is one of Cowper's poems.  
My 17, 6, 19, 20, is a means of security.  
My 26, 27, 8, 12, follows the sun.  
My 5, 13, 11, 15, 20, is a fish.  
My 1, 11, 21, 25, 17, 10, is a deadly conflict.  
My 3, 2, 4, 14, is obtained on Broadway for five cents.  
My 9, 22, 28, 23, 24, is in every blacksmith shop.  
My whole is a proverb. **GOODBY TWO SHOES.**
2. I am composed of 19 letters:  
My 8, 9, 2, 10, 11, is what an elephant is.  
My 3, 16, 17, 18, is a title.  
My 13, 2, 17, 18, 19, are what dogs and rattlesnakes have.  
My 15, 4, 1, is a sort of margin.  
My 1, 7, 2, 5, is an article of food.  
My 19, 6, 12, 14, sometimes kills things.  
My whole is excellent advice. **EDDIE G. W.**

## CONCEALED ANIMALS.

1. Do you admire that statue of Rogers?
2. I think that tub a trifle too small.
3. I would rather have a larger one.
4. Let me know, briefly, what you do want.
5. Jim, are all the doors locked?
6. Did you ever probe a ripe watermelon?
7. Yes, with a real sharp knife.
8. Tell the farmer to bring oats and hay.
9. Lend me your knife, Will, I only want it for a minute.
10. Jones lost a great deal of money.
11. I was able to give him a little help.
12. You always do good if you can.

## METAGRAM.

Find a word of five letters, from which make ten nouns, six verbs, an adverb, and a preposition.

## ANAGRAMS.

- |                    |                       |
|--------------------|-----------------------|
| 1. Second credit.  | 6. O yes! grunt.      |
| 2. Give a net.     | 7. Saul got lace.     |

## The Doctor's Correspondence.

"A CANARY BIRD CHANGED INTO A SNAKE."

A correspondent, "G. W. R.," writes under the above startling heading that: "A few days ago, a family in Nicholas County, Ky., returned to their house after some hours absence, found a snake in the cage where they had left a canary. It had crept into the cage, dined on canary 'an naturel,' and was unable to retreat between the wires. This individual could not lay claim to the common wisdom of serpents. It was called a *house snake*. That fine meal was its last."

## INSECT EAT INSECT.

Yesterday's mail brought us a little wooden box, in which there was the remains of a large, green "worm" (Tomato-worm), having what looked to be a lot of small white eggs all over its back. It was these "eggs," doubtless, that led the boy, large or small (men are boys of a larger growth) to send the worm. It is not the first time that this same kind of worm and its "eggs" have been brought to my notice. Recently a man came to me out of his tomato patch with one in his hand, and a question as to the "eggs." The last time I called at the family drug store, the clerk showed me "a great curiosity." It

Illustrated Rebus No. 480.—A piece of good news to many, concerning a character in the Bible.

was a "great, green worm, with its eggs all over its back." The man of pills and powders had gone farther than some of the others, in stating that the white, oval bodies, which stood on end over the upper surface of the Tomato-worm were the eggs of the worm that was bearing them. The engraving here given shows the worm with its curious load. In the first place: Can the white "eggs" be those of the "worm?" The

story of the changes through which many insects pass in their growth has been frequently told, but it will bear a brief statement here. In the growth of the Tomato-worm, for example, there is the egg which hatches into the *larva*, or "worm" state. From the larva state the insect passes into the *pupa*, where, unlike the "worm," it is inactive, and does not eat. Out of the pupa, the mature, or perfect insect develops, and in the case of the Tomato-worm it is a beautiful moth. It is the perfect insect, or last stage from the egg, that lays the eggs, and the circle is completed. It is thus plain that the green "worm" did not lay the "eggs" which it carries on its back. But where did they come from? All insects do not live on plants; some, yes, many live on animals, and some make their home within the bodies of other insects. Our enemy, the Tomato-worm, has its insect enemies. A minute, fly-like insect, with a sharp probe, pushes a number of its eggs into the caterpillar's body when it is quite young. These eggs hatch, and the *larvæ* from them feed upon the substance of the Tomato-worm. This may be one reason why the

THE TOMATO-WORM—WITH "EGGS."

Tomato-worm ate so much of the Tomato vines, he having so many mouths to feed. When these little "worms" of the fly were ready to go into their *pupa*, or resting state, they made their way to the surface and spun, each for itself, a pretty white oval cocoon, which was fastened by one end to the back of the Tomato-worm. Doubtless, in many cases, the infesting worms kill the large green ones upon which they feed, and are thus beneficial, our friends—because enemies to one of our enemies.

## Alligators and Their Ways.

Worcester's Dictionary says: "The Alligator of North America is a formidable and ferocious creature, prodigiously strong, and sometimes attaining the length of eighteen feet." What a list of long words to tell us what the Alligator is! But as long words are in order, let us give the scientific name of this formidable, ferocious and prodigious animal, which is, *Alligator Mississippiensis*. (The name has i's (eyes) enough for three alligators). From the long tail end of the name it might be supposed that this animal had something to do with the Mississippi River, and such is the case; its muddy banks and sluggish waters are its native haunts. One of the leading features of the alligator is its mouth, it being very large, extending far behind the eyes, and furnished in each jaw with a single row of teeth, all of different sizes, standing apart from each other. The mouth is evidently made for taking food, and that in large pieces. The alligator has long enjoyed the reputation of having a good appetite, and, when full grown and pretty hungry, will not object to a man for a meal. Some one has remarked that the alligator has a very "open countenance," and from what we have seen of them we are of the same opinion. After the head comes the long tail—with a body on four short legs between—and is the part which is the most used when swimming. For travelling on land, the heavy tail is of little or no use, and had better be off; but then, it is handy as a weapon of defence in times of danger. Alligators take no food in the winter, and this may account in part for their great appetite during summer. While going without food they bury themselves in the mud of the river. In the spring the alligator lays fifty to sixty eggs, about the size of those of the goose, which they cover with sand, and leave to hatch by the heat of the sun, though the mother does not go far away. When the young alligators come from the shell they are about six inches long; and, like ducks, take at once to the water. Little alligators are frequently caught and kept as pets. The engraving above was made from a photograph of one thus employed. He stood very

well to have his picture taken. Persons who go South to spend the winter frequently bring a young alligator with them on their return in the spring, and it is not an uncommon thing to find one or more, from two to three feet in length, sporting in the water tank of a gentleman's plant house, or even basking on the sunny slope of a pond in the garden. While young they are harmless,

A YOUNG ALLIGATOR.—(From a Photograph by Schreiber.)

and covered as they are with shiny plates or scales, are interesting animals; perhaps doubly so, when one knows the hideous aspect, disgusting habits, abominable smell, etc., of the full grown ones in the wild state. There are instances on record where these "pcts" have escaped from their confinement and turned up in places least looked for, and at times when they were not expected; in fact, have done harm by biting infants and children. An alligator that has reached any great age is not to be trusted. A safe alligator is a dead one, and we do not care much for them even then. It is told for a truth that in some parts of the South, in the home of the alligator, they hunt them, using young negroes for bait. The colored lad is sent into the water, and when the "formidable, ferocious creature, prodigiously strong," takes after him, he (the alligator, not the boy) is shot in the eye by a bullet, by a marksman concealed in the bushes on the bank. For our part we do not envy the lad—attractive as he may be to the alligators upon his track.

## A Strange Way to Set Out an Orchard.

The boys and girls are constantly asking me to answer all sorts of questions. The last one is that which relates to the strange way in which the trees were set in an orchard. I do not know whether they were apple, or pear, or cherry trees, as far as that goes it does not make any difference. The story runs something like this: An old country Squire planted a number of trees when his son was born, and on the twenty-seventh birthday of the young man, there was a tree for every year, and yet these twenty-seven trees were standing in ten rows—with six trees in each row, or six times ten, which makes sixty—the age of the father. The great question with the children is: How did he set the trees? It is certain that each tree must count in more than one row, and must be so placed that the rows always contain six trees, no more and no less. I have found out the way and can best explain it by the diagram which is here given. The trees are set in a triangular-shaped orchard, and very irregularly as regards the distance between them. The dotted

PLAN OR DIAGRAM OF THE ORCHARD.

lines show the rows, five of which run out from A, and the same number in like manner from the corner B. No further explanation is needed than that which the diagram gives. It can not be recommended as an economical method of setting an orchard; but if, like the Squire, you have only twenty-seven trees, and want ten rows, with six in a row, there is no other way to set them, as far as I know to make the strange orchard. U. H.

### A Lantern to Light His Way.

There is something frank and generous in the very appearance of large, well-formed, deep-colored, matured pumpkins. They have not the delicate bloom upon their cheeks that we find on the peach; they do not hang in graceful clusters, as do the sweet and juicy grapes, but they have an important place to fill in the list of farmer's fruits. Though coarse and unpleasant to the taste when "eaten from the vines" (?) the pumpkin is not beneath the notice of the boys of the country. Plant no pumpkin seeds, and let no vines run among the corn, and you surely take from the country youth a source of autumn pleasure that

jack-knife with some dexterity. George and I—whom you may remember went after the squirrels and fell asleep in the woods—were the architects of the "Lantern" in question. It was made from the best pumpkin that a ten-acre field of corn could afford—it was not the largest, as that would have been too big, and we could not have handled it so well—but was of fine shape and had a smooth skin and a thick rind that made it valuable. It was made with no great care, only that the face was to be, as we called it, "outlandish." We wanted it to be "the worst-looking 'Lantern' that you ever saw." Well, I guess we succeeded, and when the candle was put in and lighted, its face, though radiant with a "warmth of

footsteps of the Morgan horse. How funny we all felt behind that barrel, almost holding our breaths and fearing it might be some one else, that we would not care to see, or have see us. But everything was well for us, and shortly the boy, thoughtless of surrounding preparations for him, and possibly deep in some algebraic problem, and the lazy horse, reached the point opposite us. George wished to turn the "Lantern" upon him just before he got to us, but that would not have done, as the horse, slow and lazy as he was, might have wheeled and thrown the young rider. All we wished to do was to speed him on his homeward way. We threw off the blindfold, and gave the pumpkin a half turn, and—and—I do not think we

HOW THE BOYS WITH THE PUMPKIN-LANTERN LIGHTED THEIR FRIEND ON HIS WAY.

nothing else can replace. It hardly need be said that I now refer to the "Pumpkin Lantern," or "Jack-Lantern," as it is frequently called. What boy of any considerable size has not seen one of these truly mirth-provoking things! Yes! What boy has not found himself watching, day by day, some early pumpkin which he has in some way marked for his own—and a little later has made his jack-knife do its artistic work in chiselling out the astonishing mouth with its double row of notches! Who has not rimmed and gouged away at the irregular eyes—and by removing a three-cornered piece of the "shell," made the organ of smell? What boy has not had desperate failures in trying to make a fine, noble-looking face, or perhaps has more frequently tried to imitate rather the countenance of some person whom he has seen, and thought peculiar in some part of the face. A crooked nose is often exaggerated, and if the mouth is large, or small, it can be easily made larger or smaller.

I do not remember the first time I made a "Jack-Lantern," and I have no recollection of what became of it after it was made; it probably was a sorry imitation of some human face and the pumpkin was doubtless a small, green one, as such can be easier cut, and earlier in the season. Whatever the first one may have been, I remember one that "we boys"—it was a partnership concern—made when I was old enough to own and handle a good

expression," as artists might say, in beauty it was far inferior to that of a wax doll. We had often made "Lanterns" before, and had frequently shown them unexpectedly to each other, and made them call on the older members of the household, just when they did not expect a visitor at the door—or suddenly let the bright-eyed, great-mouthed monster glance in at the open window when all else was darkness within and without.

Now, we did not have any dislike to neighbor Morgan's oldest boy; he was "one of us" on many a play day; but as things were arranged, he knew nothing of the "Jack-Lantern" which George and I had made. The Morgan boy attended school at the village academy—we didn't—and went to and from home on horseback. We knew about the time he returned, and the thought struck us—I do not recollect which was struck first—that it would be a good thing for the Morgan boy, to stir him and his horse up a little, as he (the boy) was altogether too slow on his way home, thus avoiding some chores that would otherwise naturally fall to him. The "Lantern" was too heavy for us to hold in our hands, so we found an old barrel near by, which we placed upon the roadside—it was already dusk—and rested the "Jack" upon it, with its face toward the fence, and blindfolded with a cloth. Soon after the candle had got to burning nicely, and the darkness had settled upon all things, we heard the slow

shouted, but it may be we did, but the Morgan boy had something to say, and as for the horse—he was busy with his legs, and more so than he had been for many a day. The surprise was not great enough to frighten the boy off of his horse, as it might have done, and we are glad it did not; but it gave new life to the burden-bearing animal that did not die out until the rider was carried to the horse's stable door. I picked up the fallen hat, and trotted on far behind, and took it to its owner; it giving me an opportunity to tell him that nothing mean was intended—only a little fun—just wanted to light him home, as it were, for the night was a dark one. The Morgan boy was invited to our house on the next Saturday, and we all hands talked the matter over, and came to the conclusion that it might have been much worse. Revolving lights along the sea coast are now frequently used to keep vessels from running into danger; but a revolving "Jack-Lantern"—one that turns upon a barrel head, in the hands of mischievous boys, even though they are all in fun, when used to light up a safe place in a common road, may in itself be the source of anything than safety. Having had the experience, I give it, with the accompanying engraving, sketched from memory, not to encourage the young readers to do the same, but rather to show them in a pleasant way, at least one thing that had better be left undone. UNCLE HAL.

**Western Immigration.**

Those energetic farmers who contemplate making a change from the hard drudgery and incessant labor on a sterile farm in the Eastern or Middle States, to the broad, rich lands of the West, where, by the same energy, lighter labor, and less care, a competency can be secured in a few years, should not fail to consider well all the conditions and advantages offered to settlers by the Land Department of the Winona and St. Peters R. R. Co., which offers lands in the very center of the Great Wheat-growing region on such terms that they are within the reach of every man. These lands have the climate and soil for all kinds of grains, while they are traversed in all directions by railroads, so that the crops can be easily and cheaply sent to market. No one should think for a moment that all the good lands have been taken up—such is not the fact. The lands now offered are in every respect equal to any that have been settled in years past. Terms, conditions, and all information free on addressing CHAS. E. SIMMONS, Land Com'r., Chicago, Ill.

**Visit Beatty's Organ Factory.**

The Hon. Daniel F. Beatty extends to all a cordial invitation to visit his organ manufactory at Washington, N. J. Those of our readers who may desire to purchase either a piano or organ can then have an opportunity to select the instrument they want personally. Besides, it is a treat to go through so large an establishment as that of Mayor Beatty's. He has made a wonderful success of his business, and is said to be the largest of its kind in the world. Those who are unable to visit him are requested to send for his Holiday Newspaper, sent free. Read Mr. Beatty's advertisement on second cover page.

Wagons, Plows, Mowers and Reapers. Reliable and guaran-  
teed as represented. Protect your Horse, save your money,  
by procuring the celebrated **D. R. FISHER & CO.'S** I. X. L.  
Spring Tug Link. Ask your hardware man for them, or  
send to  
**D. R. FISHER & CO.,**  
Corner of 4th and Wood Streets, Pittsburgh, Pa.

## CHICAGO SCREW PULVERIZER.

Does Pulverization pay?

**ABILENE, KANSAS, Nov. 10, 1879.**  
I seeded 3,400 acres of wheat with these machines....The  
stand of wheat is now the best I have ever seen on new  
land.  
**R. J. WEYMES, Trustee.**

**DANVILLE, ILL., Dec. 4, 1876.**  
This year I harvested, on 190 acres, 6,100 bushels of wheat.  
...In my opinion the Screw Pulverizer increased the crop  
one-third over what I could have got by any other method.  
**D. G. MOORE.**

Send for pamphlet with cuts, and over sixty letters from  
men who have the machine. Address,

**Chicago Scraper & Ditcher Co.,**  
34 METROPOLITAN BLOCK, CHICAGO, ILL.

tion. Address

## BROCKNER & EVANS,

Sole Manufacturers. Importers of Galvanized Wire  
Nettings and Sheep Fencing. Dealers in Patent Steel-Barb  
Fence Wire.

422 West Street, New York City.

## GALVANIZED

## CABLE FENCE STRAND.

The only Wire Fence that stands the test  
of time.

NO BARBS.

**PHILIP S. JUSTICE,** 14 N. 5th St., Philadelphia, Pa.

## SEDGWICK BROS.,

## STEEL WIRE FENCE.

Is the only general purpose wire fence in use. Being a  
strong net-work without barbs, it will turn dogs, pigs, poultry,  
as well as the most vicious stock, without danger to either  
fence or stock. It is just the fence for farmers, gardeners,  
stock-raisers, and railroads; very desirable for lawns, parks,  
or cemeteries. As it is covered with rust-proof paint it will  
last a lifetime. It is superior to boards in every respect,  
and far better than barbed wire. We ask for it a fair trial,  
knowing it will wear itself into favor. The Sedgwick  
gates, made of wrought iron pipe and steel wire, defy all  
competition in neatness, lightness, strength, and durability.  
Ask hardware dealers, or for price list and particulars ad-  
dress **SEDGWICK BROS.,** Richmond, Ind.

## EVAPORATING FRUIT.

**SENT FREE** Treatise on improved methods. Tables, yields,  
prices, profits, and general statistics.  
**AMOS STOUTER,** Chambersburg, Pa.

## FREN TRESS.

Steel  
Barb

Wire  
Fence

Patented Dec. 14, 1875.

Re-issued May 22, 1877.

The Best and Most Durable  
of All Barb Wire in Use.

A sure protection, cheaper than board or rail fence, and good for a lifetime. Wastes no ground. Has no weedy fence  
row. When the best costs no more than an inferior article, always look for the best. We claim for the **Frentress &  
Superiority over all other Wires.** For Circulars and Price Lists address  
**ST. LOUIS WIRE FENCE CO.,**  
814 & 816 N. 2d St., St. Louis, Mo.

**FRENTRESS BARB WIRE FENCE CO.,**  
East Dubuque, Ill.

## STOCKBRIDGE MANURES

Now is the time to order for **FODDER CORN, HUNGARIAN GRASS, BUCKWHEAT, TOBACCO,  
BEANS, TURNIPS, etc.** For Pamphlets and Price Lists send to

**BOWKER FERTILIZER CO.,** 3 Park Place, New York.  
43 Chatham St., Boston, Mass.

## C. GILBERT'S STARCH

# CHEAPEST and BEST FERTILIZER.

FOLLOW NATURE,

Which uses **GROUND Limestone** in making the Soil.

Every Farmer can prepare his own **FERTILIZER** with an **ORDINARY HORSE-POWER.**

FORSTER'S

## COMBINED CRUSHER AND PULVERIZER

Crushes and grinds Limestone at **one operation.** **GROUND LIMESTONE** has been in use in Germany as a **FERTILIZER** for **fifty years**, and found to be **three times** as valuable as **Burnt Lime.**

With the above Machine it does not cost as much as Burnt Lime.

W. W. REED, of Erie, Pa., says: "The **ground Limestone** proved to be the most economical Fertilizer, showing a profit over Bone Dust of \$1.56 per Acre—over Phosphate of \$4.8 per Acre—over Guano of \$9.70 per Acre—and over Salt of \$5.90 per Acre."

JOHN G. BEAR, Montgomery, Lycoming Co., Pa., says: "I believe it to be the **cheapest** and **best** Fertilizer in this country."

WM. BENSON, Waterford, Pa., says: "I am satisfied that where the ground Lime was sown the crop was increased **fifty per cent.**"

Two or three Farmers can join and purchase a Machine that will supply themselves and their neighbors. Any boy can attend the Machine, which is **exceedingly simple** and **not liable to get out of order.** For full particulars address

**TOTTEN & CO., Pittsburgh, Pa., Only Makers.**

## MILL MANUFACTORY

ESTABLISHED 1851.

Grist Mills of French Buhr Stone.

Portable Mills for Farmers, Saw Mills, etc. **18 Sizes and Styles. Over 2,000 in use.** \$80 and upwards. Complete Mill and Shelter \$95. A boy can grind and keep in order. Adapted to any kind of suitable power. Complete Flouring and Corn Mill. **ALL SIZES.** Send for Circular No. 28. **NORDYKE & MARMON CO., Indianapolis, Ind.**

## Monarch and Young America CORN & COB MILLS.

Only Mills made with **Cast-steel Grinders.** Warranted superior to any in use for all purposes. Will grind faster, run easier, and wear longer. Satisfaction guaranteed.

Also Corn Shellers, Feed Cutters, Cider Mills. Send for circulars and prices.

Manufactured by **WHITMAN AGRICULT'L CO., ST. LOUIS, MO.**

## Big Giant Corn Mill, Every Man His Own Miller.

The only Mill that will grind Corn with Shuck on without extra expense. The only Mill grinding Corn and Cob successfully, that will grind Shelled Corn fine enough for family use.

Grinds twice as fast as any other Mill of same size and price.

MANUFACTURED BY

**J. A. FIELD & CO., St. Louis, Mo., U. S. A.**

## The "Centennial" Fanning Mill.

The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover, and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers.

**STEPHEN FREEMAN & SON, Racine, Wis.**

## The Triumph Wind Engine.

It runs with less wind, is more powerful, better constructed, therefore more durable, less liable to derangement by storms than any other similar machine offered in the market. It has self-oiling boxes. It is well balanced, turning easily to any point of the wind. We make the Celebrated Racine Wood Pump, Chain Pump, Tubing, Tanks, Washing Machines, and Papering Machines, etc.

Send for free Illustrated Catalogue.

**WINSHIP BROS., Drawer 91, Racine, Wis.**

## The IRON DUKE WIND MILL is the Best and Cheapest

for the following reasons:

It is **ALL IRON.** Is **Self-Regulating.** Will pump with less wind than any mill ever made. Will not shrink, warp, split, decay, and will stand more work than any mill extant.

**DON'T BUY** till you have received our Circular.

**O. S. GILBERT & CO., Manufacturers, Indianapolis, Ind.**

## THE CHAMPION WIND MILL POWER

The Best in the World.

It is perfectly self-regulating, and presents no unnecessary surface to the wind. It is pronounced by millwrights and mechanics to be superior to all other mills made. Do not buy until you have investigated the Champion. All information regarding the mill free.

**POWELL & DOUGLAS, Wankegan, Ill.**

We manufacture the old reliable **Stover**—the well tried, strong, durable self-regulating, solid wheel **Wind Mill**, which took the Centennial Diploma, as well as a Medal. We refer to the **Official Centennial Report.** Also **O. E. Winger's** improved \$20.00 double Feed Grinder, which is operated by Pumping Wind Mills—a novel and perfect Mill for grinding all kinds of grain for stock and house use. Agents wanted everywhere. Send for catalogue **B. Branch Factory at Kansas City, Mo.**

**E. B. WINGER, Successor to STOVER WIND ENGINE CO., Freeport, Ill., U. S. A.**

## This Wonderful Improved Saw Machine

is warranted to saw a **two-foot log in three minutes**, and **more** cord wood or logs of any size in a day than **two men** can chop or saw the old way. **Every Farmer and Lumberman needs one.**

**CT. AGENTS WANTED.**—Illustrated circular and terms Free. Address **FARMERS' MANUFACTURING CO., 178 Elm Street, Cincinnati, O.**

**L. E. RANSOM, 34 MAIDEN LANE, N. Y. CITY. Perfect Butter Color at lowest prices.**

## WELL BORING, ARTESIAN WELL DRILLING & MINERAL PROSPECTING MACHINERY.

and how to use, is fully illustrated, explained and highly recommended by the "**American Agriculturist**" in the November Number 1879: Page 465. Send for it. Portable, low priced, worked by man, horse or steam power. Needed by farmers in every county. Good business for Winter or Summer and very profitable. Can get good wells in earth or rock anywhere. We want the names of men that need wells. Send for illustrated price-list and terms to Agents. Address, **Pierce Well Excavator Co., 29 Rose Street, New York, U. S. A.**

## WM. D. ANDREWS & BRO., TUBE WELLS.

235 BROADWAY,

Opposite Post-Office, NEW YORK.

## Removal of the Depot for W. S. Blunt's Universal Force Pumps.

Secured by letters patent.

**THESE PUMPS HAVE RECEIVED THE "MEDAL OF SUPERIORITY."**

The highest award of the American Institute for 1878 over all competitors.

These pumps have enormous power, and are for the house or for **out-door wells** of any depth. They are constructed with special regard to strength, ease of working, and durability.

They can be immediately changed from lift to force pumps, and the handle can be placed to work at any desired angle with the spout. Having close tops, they cannot be tampered with. Attention is called to our new elegant pattern **DEEP WELL non-freezing FIRE PUMP.** Also, **Blunt's Sand Vacuum Chambers.**—A complete protection against sand or gritty water in dug or driven wells, pits, mines, and rivers. For hand or steam pumps, all sizes, from 1 1/4-inch to 4-inch suction pipe.

Send for circulars to

## DRY GOODS

**BY MAIL OR EXPRESS.**

OUR MAIL ORDER DEPARTMENT is now so systematized, and in charge of such thoroughly competent and experienced hands, that persons unable to visit our store can do their shopping by writing us for samples or goods, with the assurance of getting them at the same prices as if buying in person. We carry an average stock of about half a million of dollars, all bought for prompt cash in the markets of Europe as well as in this country. Try us, and see how cheaply and quickly you can get what you want by mail or express. When in town we shall be pleased to have you call on us.

**SEND FOR CATALOGUE OR SAMPLES.**

**COOPER & CONARD,**

IMPORTERS AND RETAILERS,  
Ninth and Market Streets,  
**PHILADELPHIA.**

Established 1852.

Mention this paper.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from Page 459.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

**The German Edition.**—All the principal articles and engravings that appear in the *American Agriculturist* are reproduced in the German Edition. Besides these, there is a special department, edited by an eminent German cultivator. Our friends can do us a good service by calling the attention of their German neighbors and friends to the fact that they can have the paper in their own language, and those who employ Germans will find this Journal a most useful and acceptable present.

**Bound Copies** of volume 38, and of every previous volume back to Vol. XVI. (1857), neatly bound, with gilt backs, Index, etc., are supplied at \$2 each (or \$2.30 if to be sent by mail). See Publishers' Notes, 2d cover page.

**Clubs** can at any time be increased by remitting for each addition, the price paid by the original members; or a small club may be made a larger one at reduced rates, thus: One having sent 6 subscribers and \$7, may afterwards send 4 names more and \$3, making 10 subscribers for \$10.00; and so for the various other club rates.

**Terms to New South Wales, New Zealand, Australia, Africa, etc.**—To several inquirers. Under the latest revision of the Postal Union Regulations the price of the *American Agriculturist* (either English or German edition), including postage prepaid through, will be covered by 7 shillings sterling per annum. This applies to the above countries, and to all others embraced in the General Postal Union. The simplest mode of remittance is by Postal Money Orders, payable in London, to the order of Orange Judd Company. These can be readily cashed in N. Y. City at a slight discount, which the publishers will cheerfully pay. For Club rates, (postage included), see our second cover page, and reckon 22 cents to the shilling sterling.

**Rust in Celery.**—The celery growers of France have united in the offer of a prize of \$2,000 for the purpose of encouraging investigation into the nature of the celery-rust, and the discovery of a remedy.

**Grass Seed Sowing.**—"C. M. H." Grayson, Cnty, Va., asks: "Which would you prefer to do, sow grass seed with winter wheat, spring oats, or buckwheat July 1st?"—Why didn't you add, 'or with turnips August 1st?'—We answer with the crops in the following order: Turnips, wheat, oats, and buckwheat, having never seen grass do well sown with buckwheat if this made a good stand. We would rather sow the grass seed on buckwheat stubble, first harrowing it thoroughly.

**Wind Mills.**—"R. S. K." The wind mill should be placed in an exposed situation, away from trees and buildings, so that it can get all the wind possible. If small it can be mounted on the barn, as is now frequently done; but it is better to have it stand by itself, and should be as near the well or spring as is convenient.

**Alfalfa, or Lucerne in California.**—"S. C. H." Downey City, California, writes that Alfalfa can be grown in his region at less expense than any other fodder crop. He says: "Once sown on deeply cultivated land, free from weeds, it is good for ten years, or even more, with us. Twenty pounds is abundant seed for an acre—some think more—but it should be sown thickly. Let it stand thick and it is finer, and more tender. . . . From seven to nine cuttings can be obtained from it, and from fifteen to twenty tons of cured hay a year made to the acre. . . . This hay must be cured as rapidly as possible, raked in windrows, and bunched the second day, rather letting it cure in bunches than in any other manner, to prevent the leaves falling off; then housing or "shedding" it soon as possible, sprinkling salt through it, to prevent mould.

\$1.25 a Year.

## The Farmer's Guide and Account Book.

How deep, how much, etc., etc., to sow or plant 70 different articles, and the fertilizers required. Systematic farming, gardening, and accounts—Highly commended by Ex-Gov. Horatio Seymour and the agricultural schools. Price \$1.25, and sold by booksellers generally. NATIONAL BLANK BOOK CO., 66 & 68 Duane St., New York.

3 AUTOGRAPH ALBUMS, all different, for 25 cents.

64 PAGE AUTOGRAPH ALBUM, Illustrated with 32 PEN SCROLLS, BIRDS, MOTTOES, FERNS, new 32 Japanese Designs (JAPANESE COVER) & 100 Album Quotations, ALL FOR 15c. 6 for 60 cents. J. F. INGALLS, Lynn, Mass.

**"Tumble Bugs."**—A subscriber asks if there is any animal that will destroy the common beetle, known as the "Tumble Bug."—The detested skunk lives upon beetles and other insects, when he can get enough, and is a most faithful seeker after, and destroyer of, them. Whether he delights in the peculiar, and, to us, unattractive flavor of this beetle, or eschews the same, we cannot tell.

**English and American Implements.**—The English manufacturer makes his implements heavy, without much regard to the strength needed. Their forks, whether for spading, or hay, or manure forks, are much too heavy, and are most unwieldy, as compared with the neatly shaped, lightly built, and easily handled American forks.—The English plow is usually three times as heavy as ours, twice as long, and much less easily handled. The cradles they use in cutting their grain would not be used by one of our reapers, and so with many other of their heavy farm implements.

**Hillside Garden.**—"T. B. B." writes: "I have a garden on a hillside, on a slope of about 15 to 20 degrees. It has been worked only this summer. How can I best place it in condition for next year's gardening? It is a lot of about 4 by 8 rods. I thought of plowing it this fall, and manuring it heavily before plowing. Would it be best to manure this fall and plow under, or manure next spring; it is a rather hard, clayish soil?"—It might do to spread the manure and then plow the ground in ridges running up and down the hill, but it would probably be better to ridge the land with a plow or spade, and then sow on a pretty liberal dressing of lime, slaked with old brine, whitening the whole surface. This will act during the winter, and the manure may be applied in the spring after "splitting" the ridges, when the manure can be turned under with a sidehill plow.

**Plant Lice or Aphides.**—The number of Plant Lice possible to be produced from a single individual during a season is very great. The following is a table prepared by M. Foulard to illustrate this point:

Generation, or brood.—Produce.

- 1st, 1 Aphid,
- 2nd, 100 Aphides,
- 3d, 10,000 Aphides,
- 4th, 1,000,000 Aphides,
- 5th, 100,000,000 Aphides,
- 6th, 10,000,000,000 Aphides,
- 7th, 1,000,000,000,000 Aphides,
- 8th, 100,000,000,000,000 Aphides,
- 9th, 10,000,000,000,000,000 Aphides,
- 10th, 1,000,000,000,000,000,000 Aphides,

Or one quintillion in a single season. Mr. Huxley calculates if a louse weighs one-thousandth of a grain "the tenth brood alone would, if all its members survive the perils to which they are exposed, contain more substance than five hundred million stout men, to say the least, more than the population of China." The fact that there is no such appalling production of the Aphides is an illustration of the fact that there is a great struggle for existence which this vast productive power is designed to meet in the case of these small insects.

**Horseback Riding.**—Fifty or a hundred years ago the saddle was quite sure to be found in the farmer's barn, as one of the necessary articles of the farm—but now it is too much put one side for the harness and buggy. At this season of the year, when the roads are bad, the saddle should be more generally used, on the ground of both economy and comfort. Boys, and girls too, should learn the art of horseback riding; as far as possible every farmer should have a horse suited to the saddle.

**To Catch Red Ants.**—"Mrs. F. E. M." Monmouth Co., N. J. A number of persons who have tried it, inform us that a plate covered with a thin coat of lard, or other grease, will attract and catch the ants, from which they can be wiped with a cloth, and a new coating of lard put on, and the trap is set again for the pests.

**Pedigree in Seeds.**—A thorough-bred animal—one that is registered in the herd book and has therefore a pedigree—is the result of a series of generations of careful breeding. Such an animal has had certain characteristics fixed by the process of selection, and possesses the power of transmitting those characteristics, just in proportion to the purity of the breeding and the time it has been carried on. An intelligent breeder of live stock looks as much to the history of an animal as to the animal itself, and is satisfied only when both accord with his ideas of good points, and those brought out in a way that makes them hereditary. When we come to plants, the same laws hold with equal force and importance, but a pedigree is rarely insisted upon in the selection and purchase of seeds. If the wheat is plump and the corn is full and bright, that is sufficient, and questions are seldom asked as to the method by which the plumpness or brightness has been obtained. Consider what a host of new varieties of seeds are thrown upon the market every

year, which are never heard of after their first sowing, because they are not the results of close breeding, and therefore have not the property of transmitting the qualities peculiar to them. Pure seed should mean that which has resulted from the in-breeding of a variety, for a sufficient length of time, so that the qualities have become fixed, and will be perpetuated. There is a wide field for seed breeding, and in it our grains and grasses may be greatly improved. A "Herd Book of Blooded Cows" sounds very strange, but may it not be that a pedigree of a "Dent," or an "Evergreen," can be established and the history of it stated by sires and dams, in much the same way as these terms are used in a herd book of Jerseys?

**Fair Tests for Draft-Horses.**—A horse should be at his best when in the harness; it is there that he does the greater part of his work, and it is of prime importance that trials in the harness be more frequently made at our fairs. Thousands of breeding stallions are never broken to harness, and if so, are never taught to handle themselves properly with a heavy load. A spirited horse out of the harness does not always mean one that will stand the test of hard work. Breeders of draft horses very generally make their selections entirely by sight, and not from results of trials of strength and endurance. It is our belief, that much more stress should be put on the action of the animal when at work; and any system of testing the horse in the harness, with a heavy load, will lead to an improvement in draft horses.

**The Union Stock Yards at Chicago** are the most extensive of any in America, if not in the whole world. In a recent visit the writer found much to interest and instruct, and a little that was amusing. The case, rapidity, neatness, and we may add humanness, with which the work was done, made us quite in love with wholesale slaughter. The yards occupy 350 acres, and will accommodate 10,000 cattle, 120,000 hogs, and a larger number of sheep and horses. Fifteen hundred car loads of stock can be unloaded, put in pens, fed and cared for in a single day. Those who have not visited the Union Stock Yards, and have an opportunity, should not fail to improve it, and see the work done.

**Beech and Chestnut Timber.**—"A. P. P.," of Long Island, is about to cut some 40 or 50 acres of timber, consisting of Chestnut and Beech, which have stood for 35 or 40 years, and wishes to devote the ground to the culture of the same kind of trees. He asks, "shall I wait for a spontaneous growth or plant seed? Some of my neighbors say that soft woods only spring up, such as Birch and Pine. How far should the young trees be left apart?"—Beech and Chestnut trees are so dissimilar that they are usually not planted or suffered to grow together. The beech is best propagated from seed, the chestnuts spring up readily from the old stumps. The usual plan is to trust to this vitality of the old chestnut roots to establish the new stand, but with beech it is usual to wait for a fall mast, then to scarify the soil under the trees, so that the nuts shall find a soft seed bed—and when the new crop is fairly sprouted, to cut off most of the wood, leaving some trees standing for shade and protection. The young growth is supposed to grow at first very thick—then it should be thinned out for hoop poles, afterwards for charcoal, and finally for scaffolding poles, fencing stuff, or firewood, while the remainder stands for timber.

**Barrenness in Cow.**—Mr. "T. H. C.," Wilkesbarre, Mass.—The only advice we can give you in the case of your cow, is to convert her into beef as soon as possible; there is no known remedy for confirmed barrenness, and the best course in such cases is to get a cow that will be useful, and not try experiments that are most likely to fail. Of course, if the cow has been sold under false representations, you have a legal remedy.

**The Queens Co. Show** lost much of its interest this year on account of the reported prevalence of Pleuropneumonia in the county. The farmers, from their long acquaintance with the disease, have a wholesome dread of it. It is only those who know nothing of it, and who in their selfishness and ignorance fortify themselves in a disbelief of its dangerous character, who brave it and repeal laws for its control like the farmers and legislature of New Jersey. Other departments of the show were of usual interest, and with fair weather there was good attendance.

**Oyster Shells for Poultry.**—"T. B." Certainly, roast the shells before pounding them up. A little nutritive matter is doubtless lost, but the saving of time is of much greater value than the loss from burning.

**Seedling Black Walnuts.**—Wm. Armstrong, of Wisconsin, writes:—"Last fall I procured three bushels of black walnuts from the neighboring forest, and after leaving them in a dry place until the shucks had be-

come quite dry, I placed them in a couple of barrels; alternately a layer of nuts and then a layer of damp sand; the sand must be kept moderately damp during the winter. During the January thaw I planted them, some in a permanent place by the road side, and others in the nursery, and they have nearly all grown successfully, some of them to the height of two feet. I would like to know if I could transplant those in the nursery successfully this fall. They will make a splendid wind-brake in course of time, to say nothing of their great usefulness in cabinet work. As I go into the forest I admire those stately trees planted there by the hand of nature, and wish I could protect them from the ravaging hand of man. I return and look upon those that I have recently planted, and think what a little effort it cost me, and what a world of pleasure for those who may come after to enjoy their shade and admire their stately form."—Forest trees which send down long and strong tap roots, as do walnuts, hickories, oaks, etc., should have the tap root cut off, without lifting the plant, at the close of the first season. In the early spring it may be lifted and set out again at once after trimming the roots a little. The next autumn the plant may be moved with safety.

**"The Best."**—Letters are constantly coming in asking for the best kind of sheep, the best fastening for cows, the best churn, the best feed cutter, etc., etc. In many cases there is no "the best" thing, but generally a number equally good. It is much a matter of taste which is the best for a given individual. Shall we say that this or that reaper is the best when there are many all so near perfection that the judges disagree? It will be a long time before the best in many cases will be settled beyond a doubt. While there is doubt, situated as we are, it is the best for us to keep still. To give an opinion is one thing, but to decide out and out is another.

**The Sweet Potato.**—But a few years ago it was thought that the sweet potato could not be grown north of Virginia, but it is now a profitable crop in many Northern and Western States, and instead of being a luxury, is within the reach of almost every family. The Jersey sweet potato is now much esteemed, but it is not as highly colored—not as yellow—or as rich in flavor as those which come to us from further regions south.

**"Fire-Fanging."**—"C. M. H.," asks: "How may we know by its appearance when manure is over heating in fermentation—'fire-fanging' as it is called?"—Watch it.

**Carriage Gate.**—We have several inquiries for the best carriage gate that can be opened and shut without leaving the vehicle. Good ones in use ought to be advertised; we do not know which is the best.

**American Beef in England.**—The "Privy Council" of Great Britain, as we understand their powers, are a body of gentlemen acting under the direct authority of the Queen in regard to matters which are not provided for by law, and which require immediate action. Their decisions are usually liberal and just, and their action in regard to the slaughter of American beasts 14 days after landing, though it is certainly arbitrary, and damaging both to our interests and to those of many citizens of Great Britain, may yet be of great service to us. Judge Jones, of Ohio, in a letter to the President, dated Liverpool, August 4th, after explaining the effects of this requirement, says: "The short argument of the advocates of compulsory slaughter is this—*Pleuro Pneumonia* is known to exist in the United States, and the Government has adopted no measures for its extirpation or even to determine the localities where it prevails." Of course they must regard the whole country as infected. We cannot say a word. A good bill was introduced in Congress last winter, and though strong efforts were made to carry it through, it failed. Now the Treasury Department contents itself with what it regards as retaliatory action in subjecting all neat cattle from Great Britain, though coming with a clean bill of health, to a quarantine of 90 days. This does not punish either the Privy Council or the English people, but our own importers of choice stock. It does no good, and importations of neat cattle have almost entirely ceased. Judge Jones urges the appointment by the Treasury Department, of a gentleman of character, to prescribe regulations for the conveyance of healthy beef cattle through infected districts to the ports of shipment, and to send such with a clean bill of health. When this is done he thinks American beef will be permitted to be landed and fed a while before slaughtering. We need something like the Privy Council in this country, to act in cases of emergency, when Congress fails, and when the interests of the country suffer from neglect. It would seem as if the President and Cabinet might be depended upon to act in exactly such cases as this, but they do not, and one of the most important industries of the country languishes. We are much obliged to the Hon. T. C. Jones for writing and to Mr. Hayes for publishing his letter, and sending the *American Agriculturist* a copy.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the *American Agriculturist*, from our record kept daily during the year, show at a glance the transactions for the month ending Oct. 9th, 1880, and for the corresponding period last year:

1. TRANSACTIONS AT THE NEW YORK MARKETS.									
RECEIPTS. Flour. Wheat. Corn. Rye. Barley. Oats.									
27 d's this mth	507,000	6,997,000	6,304,000	212,300	473,000	1,533,000	26 d's last mth	507,000	6,997,000

**Will a Creamery Pay?**—Will butter-making pay anyhow? If it will pay to make good butter in the private dairy, then a well managed creamery will pay; but it must be well managed. A question to which this is the answer comes to us from Montgomery Co., Pa. There are several reasons why creameries fail to be profitable. If one farmer's milk has 7 or 8 per cent of cream and another's has 20, and others all along between, the poor milk being largely in excess, when dividends are made according to the weight of milk furnished, it is clear that not only do the men who furnish good milk lose heavily, but the creamery loses also. The cream and the butter, of badly fed, or half starved, cows has no flavor. Such butter cannot sell at a high price, and a little such milk or cream will damage the whole product. Creamery butter that cannot heat "Oleo," is made at a loss, and ought to be.

**Asbestos Liquid Paints.**—Through a number of years, the H. W. Johns Mfg. Co. have established an enviable reputation for making liquid paints that are remarkable for their durability and beauty. Their Asbestos Liquid Paints have real merit, and all who contemplate painting their farm and other buildings should bear this in mind. We can gladly refer the reader to our recommendations of this firm and its paints in the past.

**Moss Collars for Horses.**—During the late war the Northern soldiers became acquainted with Southern Moss in all its forms. They saw it growing in long gray streamers from the cypresses in the swamps. They saw the negroes gathering it, sweating it, and rubbing it free from the outer coats, leaving the horse-hair like, wiry threads which form the inside and are the useful part. This, in trade, is known as Southern Moss, and is used like horse-hair for stuffing seats, beds, etc., and as an "adulteration," so to speak, of curled hair. Twisted into ropes, it gets a regular curl like horse-hair, and it requires a moderately close inspection to tell which is which. The soldiers found saddle cloths plaited of this moss by twisting it into cords, to be most excellent, curing saddle-galls, and preventing sweat-blisters, and pads made to go under mule-collars, and wherever the harness galled, were good also. We have received a well-made horse-collar of this material, bound with leather at top and bottom, and with leather fenders to prevent wear from the trace chains. They appear to be a very good article, and we see no reason why the manufacturer, Mr. A. D. Martin, of Louisiana, should not have a large trade in them, both South and North.

**Cord Binders for Harvesters.**—A number of different materials as straw, and wire, have been in use by the self-binding harvesters, but farmers are not satisfied with the work, and have frequently applied for a binder that would employ a cord. The manufacturers of the Champion Reapers have developed an Automatic Cord Binder, which has done excellent work in the field during the past season, and bids fair to meet the want of those who have grain to cut, and wish to bind it in a neat and substantial manner.

**Grass Seed.**—"C. M. H." The seeds of the common grasses will retain their vitality two or three years, and even longer if kept dry, but the longer they are kept the slower they are in coming up and the fewer start.

**Concrete Buildings.**—"H. W. G." Steuben Co., N. Y. In Dec., 1874, we gave full descriptions of the method of preparing Concrete, and of building with it. That or any other single back number of the *American Agriculturist* for 24 years past is mailed for 15 cents.

**Sporobolus Indicus—Smut Grass.**—In response to a request in the September number, D. L. Phares of Starkville, Miss., sends the following notes on the Indian Drop-Seed Grass or Smut Grass: "This perennial plant from India is thoroughly naturalized and at home in our Southern States. In some localities it is known as 'Carpet Grass,' as are also several other grasses. Its generic name is founded on the fact of its easily shedding its seeds, and it is hence called Indian Drop-Seed Grass. Many of the panicles become affected with a dark-colored parasitic growth, which adheres tightly to clothing coming in contact with it, giving it a smutty appearance, and hence the grass is appropriately and more generally called 'smut grass.' On many commons, uncultivated fields and yards, it grows abundantly and luxuriantly, and furnishes good grazing from April until frost in autumn. It thrives well under much grazing and many mowings, and grows promptly after each, on good, moist land. Cattle and horses are fond of it; but if not kept well grazed or frequently mowed it becomes tough and they refuse to eat it unless quite hungry. From long fibrous roots it sends up clumps of long leaves in great abundance. I have just measured some leaves three feet long. This, however, is an extreme length. The culms are usually one and a half to three feet high, with panicles six to eighteen inches long. I have just

measured within a few steps of where I am writing, culms four feet eight inches long with panicles eighteen inches. The appressed panicles might be mistaken for spikes. The culms enlarge rapidly, and soon occupy the whole ground densely. In 1878, I sent to the Department of Agriculture for analysis some hay of this grass. Dr. Collier's analysis shows in 100 parts 12.46 albuminoids, 55.44 carbohydrates, 25.91 cellulose, and 6.19 ash. Although containing so much nutritive matter, it is not so much relished dried as many other grasses.

**Some Notes on Pork.**—Much as it is the custom to deery pork, it is "the farmer's meat." It is the only steady meat that many farmers can afford to have, unless too rich to need to farm at all. One reason why so much has been said against pork is the careless way in which it is often prepared. Pork that is used should always be properly cured and in good condition. I send a few recipes of my own.—**Fried Pork.**—This should be cut in rather thin slices and parboiled in a little water. Pour off the water and fry quickly. Lay it on the platter and pour over it a few tablespoonfuls of sweet cream, or if preferred the gravy in which it has been fried. Or make a batter with two eggs, half a cupful of sweet milk, and flour enough to make a thick paste, and dip the slices in this after they have been fried. Return the pork to the spider, and fry it in the batter, and it makes quite an addition to the dish. **Baked Pork.**—A square piece of fat pork may be soaked over night in sweet milk, and washed off; cut the rind in squares and bake until tender. This is very good. **Boiled Pork.**—A piece of pork boiled an hour and a half, then cut in slices and treated to a dash of pepper and vinegar, catsup or Chili sauce, makes a desirable dish to be eaten either hot or cold. "R. C. D., Walworth Co., Wis.

**Cubic Feet in a Ton of Manure.**—"C. T. S., Springfield, O. A ton of manure as generally hauled out in the spring, moist and compacted more or less, and then thrown into a wagon, will contain 40 to 48 cubic feet. It is very indefinite and must necessarily be so.

**Weeds.**—The farmers should be deeply interested in the two leading points concerning weeds: how they get into the fields and garden, and how to get those out that are already in. Many of the seeds of weeds are sown with those of the crop, especially is this the case with those that are nearly of the size, color, etc., of the grains, and grass seeds. Great care should be exercised in sowing only pure seeds. If the weeds are already in the soil, the quicker steps are taken to eradicate them the better. Let no weeds go to seed. This will end the annuals. With perennials the work is more difficult, but it should be remembered that they are much more easily destroyed when young. Cut frequently and dig out by the roots when possible.

**A Peach Trouble.**—"C. W." Wethersfield, Conn., writes: "Here are leaves from the twigs of seedling peach trees. They have appeared on our young trees in late summer and autumn, for a few years past. We throw the seeds about on our vegetable garden where they have a good soil and pretty careful cultivation, and do not have a separate nursery for the few trees we need for ourselves or to give away. I would be pleased if you could give me any light on this matter, whether it is very injurious or whether there is a remedy. I have trimmed off the affected twigs from some trees, but the trouble soon reappears. They grow rapidly nevertheless. It seems to be unlike the curling of the leaves in early summer, which was so common a few years ago, and which caused the large trees to shed their leaves once or twice, perhaps more times, in the season."—The young peach leaves are affected with a parasitic fungus which grows upon the surface, sending in here and there small root-like outgrowths for the purpose of absorbing nourishment. The white, floury, or frosty appearance of the leaves is due to the multitude of spores which have formed. The fungus is one of the White Mildews, a treatment of which, with illustrations, may be found in the *American Agriculturist* for December 1879, page 508. The oaks, maples, willows, lilacs, etc., are attacked by various closely related species of this same group of White Mildew. The European Grape Mildew—a disease which has been so disastrous to the foreign vineyards, belongs to this same group. The remedy is Flowers of Sulphur, dusted on as soon as the mealy or frosty appearance is observed. Cutting away the twigs is not recommended, as it can do very little good.

**The "International" Sheep Show.**—The display of sheep at Philadelphia was not largely International; but contained many excellent representatives of our own flocks from the East, the Great Plains, and Pacific Coast. Of the few hundred sheep on exhibition about half were Merinos, and the others were distributed amongst the Leicesters, Lincolns, Southdowns, Hampshires, Shropshires, and Oxfordshires; some of the latter were recent importations from English flocks, and of

great size. The attendance of wool-growers and breeders was not large. During the discussion the fact that "the manufacturers desire the production of precisely the kind of wool the farmers find most profitable to grow," was considered. A national registry of sheep was provided, and a winter meeting for discussion appointed, to be held in Washington in January next.

**Another Adulteration in Butter.**—The New York dealers in butter, finding that the tubs overran in weight, five to six pounds, were at a loss to account for the fact, until they discovered that the increase in weight was caused by an addition of powdered soapstone. This "loaded" butter came from the city of Cincinnati. The powdered soapstone is white, fine, and tasteless, and is sold for \$20 per ton. It is not butter!

**Canada Thistles.**—Daniel Keefe, of Penn., tried the salt cure for Canada Thistles. He cut the thistles short, August 1st, and put a tablespoonful of salt on each stalk or stub. They wilted at once, dried, and by Oct. 1st, had disappeared. This requires even less patience in application than the persistent following up with the knife, and cutting them as one does asparagus just below the surface of the ground.

**Barrels for Keeping Roots.**—The following is from one of the essays, "Keeping A Cow on Cape Cod," by Mr. Nickerson, published in the new book, "Keeping One Cow," and gives his method of using barrels for storing roots. "We have a way of our own for keeping our roots in the absence of a vegetable cellar, or when we do not want them in the house cellar. We take any old barrels, set them in the ground, the chime just coming to the top of the ground (we do not want a head in either end of the barrels). Into these headless barrels we put our beets, turnips, cabbages, etc. As the weather grows cold, we cover the barrels with some loose boards. Whenever it is cold enough to freeze hard, we throw over them enough hay or straw to keep out the wet. By this method we can, with very little trouble, at any time get out a barrel or part of a barrel of roots. In this way the roots keep in fine condition. Late in the spring, after the frost is out of the ground, turnips and beets will be as brittle and good as when pulled in the fall." Of course mice must be guarded against.

**Success in Wheat Growing.**—Mr. D. S. Curtiss in his new work on "Wheat Culture," concludes by saying: "Highest success in Wheat-growing involves and presumes skillful and intelligent management in other parts of farming, so that he who uniformly secures superior results with wheat and does not impoverish his land or soil cannot well be other than a good farmer, able to secure profitable results in all other farm operations. Hence to become an eminent wheat-grower is to become a complete farmer." Mr. Curtiss knows of what he speaks as he has had a wide experience in wheat culture.

**Insects and Fruits by Mail.**—It is safe to say that one-third of the insects and fruits sent us by mail arrive in a useless condition, on account of the frail character of the box in which they are enclosed. A paper or paste-board box rarely escapes crushing. Wooden and tin boxes usually come in good order. All such packages must be so tied that the contents can be examined. The use of nails or tacks, or closing by pasting, on strips of paper, subjects the package to full letter postage, often very heavy, and which we do not pay.

**Draughts of Cold Air in the Stable.**—Horses are quite sensitive to chilling draughts of air blowing upon them, and especially upon their heads; hence, in the construction of stables this should be borne in mind. Many stables have the horses face an alley a long the sides of which are doors, or a large space is left entirely open; in such cases, whenever the rear stable door and the one leading out of the alley are open, the horses stand in a chilling draught, from which they can not escape. Horses, like many people, can stand much wind in an open field, but will catch cold while in a draught only a short time. With proper ventilation, the doors of the stable should be kept closed in cold weather, that no draughts may occur.

**Native Amphibians.**—"C. E. N., of Lindsay, Ont., writes to us to aid him in procuring a horned toad. This we cannot do. He wishes to study its habits, etc. We advise him to study the habits of our native Amphibians, frogs, toads, tree toads, salamanders, newts, and lizards. Possibly there are no lizards in Canada, but there are others we have named. Their habits are exceedingly interesting, and not very well known even to naturalists. For very few have the patience or leisure to watch them and study carefully all their ways. All such knowledge is of use—with it we may be able to secure the cooperation of these animals in controlling our insect enemies. For they live upon insects, and it is at any rate well to know what good friends they are to man.

## "YES."—Three Years for \$4.

To sundry inquirers. Several ask if they cannot make their own subscriptions to run three, four, or more years, at the club rates, as three years for \$4, four years for \$5, and so of other club rates. We will answer, "yes," when specially desired, though the preference would be for a greater variety of names.

## November Fair List.

### Natural History of the Horse Bot.—Mr.

J. H. Parmenter, of Framingham, Mass., gives very concisely his observations and conclusions about bots, the former are so accurate and the latter so just, that we print them. Many horses die of colic, on opening their bots are discovered, and the wise ones say, "Ah! no wonder he died. There are bots enough to kill any horse."—Mr. P. writes: "I am a farmer, and have been a hatcher, and have killed and opened hundreds of horses at all times of the year, I do not pretend to know how bots get into the stomach of the horse, and I never found them in any other part of the digestive organs. They gather usually upon one side of the coating of the stomach, and arrange themselves just as thickly together as bees on their comb, and fasten there by the posterior part which is pointed. [This is an error. It is the anterior or head part which is pointed and holds on by some little hooks.—Ed.] The bots cause the lining of the stomach to thicken up half an inch or more. When the horse is poor this spot becomes inflamed and looks as raw as cut meat. The bots live (as I suppose) upon the same food as the horse, absorbing it through their skin, and when the horse is well fed does no appreciable harm; but upon an old and poor horse that has run at pasture all summer, and has a great many bots in the stomach, they become destructive to its life. I do not think the horse is ever attacked suddenly. I do not think you can give the horse any medicine that will kill the bots and not kill the horse. The bots stay in the horse until turned out to grass, or until that time of the year, and then become mature and let go their hold, pass off in the manure, and soon become a fly to lay more eggs. The eggs, deposited on the hair of the horse's legs and neck may be very readily taken off with a sharp knife, and this will prevent their being taken into the stomach.

### Cool-Room in an Ice-House.—"T. B. B.,"

Potter Co., Pa. Your cool-room will prove to be cool enough, if it is placed at one side of the ice-house, so that the ice may remain in one solid mass. The wall of the cool-room against the ice being simply of matched inch boards, will become cold, and lower the temperature of the room sufficiently for keeping fruits and meats.

### Tarring Fence Posts.—"R. S. N.," Kenosha,

Wis.—The posts should be thoroughly dry and seasoned, the gas tar should be applied hot, and all sprinkled thickly with dry sand, so as to form a uniform coating. The posts should be left out of the ground until the coating has thoroughly stiffened, or, indeed, hardened. Thus treated, they will last for a much longer time.

### Are You Going to New York? Then Stop at the

**TURKISH** 13 & 15 Laight St., New York.

**BATH**

**HOTEL,**

This well-known house is convenient of access from all parts of the city. The table is supplied with the best kinds of food, healthfully prepared. The house is noted for its pleasant parlors, and the cheerful, home-like feeling that prevails. It has just been refitted, and the prices are moderate. Connected with the house are Turkish Baths, etc., etc.

Send for circular.  
M. L. HOLBROOK, Proprietor.

Presses and outfits from \$3 to \$500. Over 2,000 styles of type. Catalogue and reduced price list free.

**H. HOOVER, PHILADELPHIA, PA.**

### Hardy Perennial Plants

Are increasing in popularity because they are

**Hardy**, their roots living through the winter—and

**Perennial**, appearing year after year in the same place.

They include the most beautiful kinds that bloom all through the season, from earliest spring to latest fall.

Autumn is in many cases the best season for setting out these plants.

Send for free descriptive Catalogue of the largest collection in the Country—including Hardy Climbers, Flowering Shrubs, Lilies, Philoxes, Ferns, etc. Also choice native plants.

**WOOLSON & CO., Box 180, Passaic, N. J.**

## CRANDALL'S TREASURE BOX.

This is one of Crandall's latest and best inventions. It is not one toy alone, but a dozen in one, comprising a Wagon, Top, Bedstead, two Chairs, Wheelbarrow, Mallet, Bench, Table, Puzzle, Set of A B C Blocks, a group of nine Domestic Animals, and a pretty Suburban Village. A most delightful combination for the little folks. **Price, \$1.00.** Expressage to be paid by the recipient.

### WHISTLING LOCOMOTIVE.

Length, 27 Inches—Height, 10½ Inches.

This new Toy is a marvel as to its simplicity. At every revolution of the "driving wheels" there is produced a good, strong whistle, which adds greatly to the liveliness and interest of the Toy, and gives much pleasure to the boy or girl—the young engineer who runs it. It is finely painted, and it can be easily seen, from the dimensions as given, that there is a great deal in it for a \$1.00 Mechanical Toy.

**Price, \$1.00.** Expressage to be paid by the recipient.

### CRANDALL'S DISTRICT SCHOOL.

Every child, and man and woman too, will laugh over this group of teacher and scholars in the "district school," and thousands of parents will recall with great delight their own experiences in childhood. The grave "master," seated by the desk, with his "whisking stick"; the boys and girls with their books; the "little lamb" that has followed his young owner into the school; the "dunce" and his cap, and the altogether comical appearance of the whole company, make this one of the most attractive toys of Crandall's invention. **Price \$1.00; by mail, prepaid, \$1.20.**

Send for a Price List of all our Games and Toys, Scroll Saws, etc.

**ORANGE JUDD CO., 245 Broadway, New York.**

## STANYAN'S PATENT BREAD MIXER & KNEADER

Saves labor and time; is easily operated, and by unskilled help; is simple, strong, neat, durable, and ornamental; has recently been improved, being now constructed entirely of metal; saves touching the bread with the hands before reaching the oven.

No. 2 size, adapted to three to four quarts of flour, now ready, and will be forwarded upon receipt of price, \$3.25.

**DUTCHER TEMPLE CO., Sole Manufacturers and General Agents, HOPDADLE, Mass.**

Money Order and Telegraph Office and Railroad Station, Milford, Mass.

### Best Holiday Gift!

Friends! here's comfort. Wife says she must have a couple of Common Sense Rockers. We all want this one.

Special discount to clergymen. Send stamp for catalogue to

**F. A. SINCLAIR, Mottville, N. Y.**

## AGENTS NEVER FAIL

To sell our Nickel Plated Home Lamp, an improvement on the Student Lamp. Why? Because it is the safest and best in the world; can be attached to the Sewing Machine, Piano, Desk, etc., and turned in any direction to suit the eyes; can not be upset; has a convenient match box and filling indicator. The religious papers in force all our claims. Our agents making as high as \$25 per day proves it a bonanza. Its low price, liberal terms, and rapid sales surprise old agents.

Address, **HOME LAMP CO., Cincinnati, O.**

## COLUMBIA BICYCLE.

The Bicycle, as a permanent, practical road-vehicle, is an acknowledged fact, and the thousands in daily use are constantly increasing in numbers. It combines speed and endurance that no horse can equal, and for pleasure or health is far superior to any other outdoor sport. The art of riding is easily acquired, and the exercise is recommended by the medical profession as a means of renewing health and strength, as it brings into action almost every muscle of the body. Send 3c. stamp for 24-page illustrated catalogue, containing price-lists and full information.

**THE POPE MFG CO., No. 101 Summer St., Boston, Mass.**

## INVALID ROLLING CHAIR.

(RECLINING)  
A Priceless boon to those who are unable to walk. Hon. A. H. Stephens, M. C., and hundreds of others use them. Send for Circular to

**FOLDING CHAIR CO., New Haven, Conn.**

Offers for sale at very low prices and on easy terms,  
3,000,000 ACRES of the most fertile lands in Minnesota,  
mostly situated in the far famed

RED RIVER VALLEY  
of the North. The Great

WHEAT GARDEN  
of the World. Three dollars per acre a lowed to settlers for  
breaking and cultivation. Large descriptive pamphlets and  
maps mailed free. Address  
D. McKINLAY, Land Com'r., St. Paul, Minn.

CAUTION!—The great popularity of, and increasing demand for our "Automatic" Sewing Machine induces unprincipled agents to deceive customers by claiming, for their old pattern machines, automatic and other features belonging exclusively to us.

THE

# "New Automatic"

or "NO TENSION" Silent Sewing Machine

Differs in all essential respects from every other Machine!  
Only Machine without a Tension, and Bobbin or Shuttle!—  
Only really Light-Running Machine!—Only Machine with  
Stitch-Regulator!—Easiest to Work!—Fastest!—Makes  
Strongest Seam!—Absolutely without Danger to Health!

As it is impossible to convey by advertisement an idea of the unique and wonderful features of this Machine, we solicit DIRECT CORRESPONDENCE from all persons owning or about to purchase a Sewing Machine, and will carefully and promptly reply to all communications.

Address,

WILLCOX & GIBBS S. M. CO., 658 Broadway, New York.

## American Agriculturist

### SUBSCRIPTION TERMS.

(English and German Edition at same Rates.)

For One or Two Subscriptions, One Year, the price  
will hereafter be (post-free) \$1.50 each, instead of \$1.60.

[ALL POST FREE.]

Three Subscribers one year.....\$1, or \$1.33 each.  
Four Subscribers one year.....\$5, or \$1.25 each.  
Five Subscribers one year.....\$6, or \$1.20 each.  
Six Subscribers one year.....\$7, or \$1.17 each.  
Seven Subscribers one year.....\$8, or \$1.14 each.  
Eight Subscribers one year.....\$9, or \$1.12 each.

Ten or more Subscribers, post-free,  
Only \$1 each.

[A free copy to sender of club of 20 at \$1 each.]

Single Numbers sent, postpaid, for 15 cents each.  
Specimen numbers for examination sent, postpaid, for  
10 cents each. Subscriptions can begin at any time.

The Above Terms are for the United States and Terri-  
tories, and British America. Add 14 cents extra per year for  
papers sent outside of the United States and British America,  
except to British Honduras. For the last named country the  
extra charge is 38 cts. per year, to cover extra postage, and  
Single Numbers, 17 cents, post-paid. Remittances, pay-  
able to Order of Orange Judd Company, may be sent in form  
of Checks or Drafts on N. Y. City Banks or Bankers; or P.  
O. Money Orders; or in Registered Letters, such letters to  
have the money enclosed in the presence of the Postmaster,  
and his receipt taken for it, and the postage and registering  
to be put on in stamps. Money remitted in any one of the  
above three methods is safe against loss. Bound Volumes  
from Vol. 16 to 38 inclusive, supplied at \$2 each, or \$2.30 if  
to be sent by mail. Sets of numbers sent to the office will be  
bound in our regular style for 75 cents (30 cents extra if to  
be returned by mail). Missing numbers in such volumes  
supplied at 10 cents each.—Any Numbers of the paper is-  
sued for 23 years past, sent post paid for 15 cents each;  
or any full year, sent unbound, for \$1.50. Clubs of  
Subscribers can be increased at any time. At the club rates,  
if new members begin at same date as the original club.

## Music Books '80-81

CHOIR BELL. By L. MARSHALL. The Crowning Suc-  
cess among Church Music Books.  
Many new gems and a few old favorites \$1. Sample copy,  
75 cts.

BAILEY and C. A. WHITE. A brilliant array of Musical  
Gems. 75 cts.

Either of the above post free on receipt of marked price.

## A Three Cent Stamp,

will secure 17 pages of New Music, 10 pages  
of Musical News and instruction, a full page  
Lithograph Portrait of some musical celebrity,  
and much valuable information. Send stamp to  
WHITE, SMITH & CO., Boston, Mass.

## 70,000 SOLD YEARLY.

The growing popularity and usefulness of  
CABINET or PARLOR ORGANS is shown by  
the fact that SEVENTY THOUSAND are sold  
yearly in the United States. The best are the

## MASON AND HAMLIN ORGANS

which have been awarded HIGHEST DISTINCTIONS FOR  
DEMONSTRATED SUPERIORITY AT EVERY ONE OF THE GREAT  
WORLD'S Industrial Exhibitions for thirteen years, with-  
out one single exception.

### NEW STYLES

Are ready this season with important improvements. FOR  
LARGE CHURCHES, splendid organs, with great power  
and variety, at \$570, \$480, \$390, and less prices; FOR SMALL-  
ER CHURCHES, SCHOOLS, &c., \$84 to \$200 and upwards,  
SUPERB DRAWING ROOM STYLES at \$200 to \$500,  
upwards; A GREAT VARIETY OF SMALLER ORGANS of  
equal excellence, though less capacity, or in plain cases at  
\$50 to \$200 and upwards. Also furnished FOR MONTHLY OR  
QUARTERLY PAYMENTS, \$5 and upwards.

These organs are certainly unrivalled in excellence,  
while the prices are not much higher than those of very in-  
ferior instruments.

Before purchasing any organ send for latest ILLUS-  
TRATED CATALOGUE (32 pp. 4to) containing full descrip-  
tions and prices, including new styles, and much useful  
information for the purchaser of any organ, which will be  
sent free and post-paid. MASON & HAMLIN ORGAN  
CO., 154 Tremont Street, BOSTON; 46 East 14th St., NEW  
YORK; 149 Wabash Avenue, CHICAGO.

MARKS' PATENT FIRST PREMIUMS.  
Artificial Limbs, with Rubber hands and feet. The  
most reliable, comfortable and useful. Illustrated pam-  
phlet of 112 pages, containing valuable information sent  
Free to those giving satisfactory description of their  
case. U. S. Gov't Manuf'r. Soldiers' attention specially  
invited. A. A. MARKS, 578 Broadway, New York City.

### NEW CHAMPION

SHOT GUN.

Retail Price.—Plain Barrels, 12 bore, \$14.00; Plain Barrels, 10 bore, \$15.00; Twist Barrels, 12 bore, \$17.00; Twist Barrels, 10 bore, \$18.00. The frame and trimmings of all these guns are Nickel Plated. This gun possesses many advantages over any single breech-loading gun yet produced in this country. It has a patent side-snap action with a safety attachment, by means of which it can be opened only when the gun is at half-cock, thus ensuring perfect safety in loading. The workmanship and materials used are first-class; no gun being allowed to leave the factory until it has been thoroughly inspected. We take great pleasure in offering this gun to the public, and feel safe to say it is the best American Single Breech-Loader yet produced. Send stamp for Illustrated Catalogue of Guns, Rifles, Revolvers, and Skates. Address JOHN F. LOVELL & SONS, Gun Dealers, Boston, Mass.

### BOLSTER SPRINGS FOR FARM WAGONS.

Made of Best Oil Tempered Steel.  
**SOMETHING NEW!**

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over three years, and are a pronounced success. No Teamster or Farmer can afford to be without them.

We want Agents everywhere. Send for description and prices, and mention this paper.

SEMPLE & BIRGE MFG. CO., St. Louis, Mo.

### GET THE BEST FARM GRIST MILL.

The grinding parts are steel. They take less power, are more durable, simple, and cheap. Send for descriptive catalogue.

W. L. BOYER & BRO.,  
Philadelphia, Pa.

Also Manufs. of Celebrated Union Horse Power, etc.

**SHORTHAND**—writing thoroughly taught by mail or personally. Situations procured for pupils when competent. Send for circular. W. G. CHAFFEE, Oswego, N. Y.

## KEEPING ONE COW.

Being the Experience of a Number of Practical Writers, in a Clear and Condensed Form, upon the Management of a Single Milch Cow.

Illustrated with Full Page Engravings of the most Famous Dairy Cows.

### NOTICES BY THE PRESS.

Designed to show the utility of every family (where it is at all practicable) keeping its own cow. The testimony given is that of the experience of quite a number of well-known writers and practical men, and the subject is one of particular interest to a large proportion of our people.

Cincinnati Live Stock Review.

Pure, rich, fresh, wholesome milk is such an important matter in a family, especially one where there are young children; that a good service has been rendered by showing how it can be produced in abundance at the cheapest rates. The volume, of convenient size, is attractively made with a number of illustrations, among which are portraits of eight famous dairy cows, one of them being a cow belonging to Queen Victoria, and now kept at the Shaw Farm, Windsor Home Park.—The Evening Mail, (New York.)

The Volume is edited by Col. Mason C. Weld and Prof. Manly Miles, authorities on dairy matters. Soil, crops, stabling, care of manure, soiling, care of cow and calf, and every conceivable point connected with the subject, are treated of under a score of different circumstances, and bring to the reader a variety of methods from which to select.

Standard, (New Bedford, Mass.)

Composed of contributions from fifteen or sixteen writers on points connected with the subject, selected from nearly 100 papers submitted for the purpose. The work is illustrated with a number of portraits of famous dairy cows of different breeds, and some other engravings of buildings, etc.—Cultivator and Country Gentleman, (Albany, N. Y.)

This book presents the individual experiences and advice of acknowledged authorities, and is designed to show that every family should have its own cow. The list of contributors to it embraces Mr. Henry E. Alvord, of Massachusetts, Prof. D. D. Slade, of Harvard College, Mr. P. S. Norris, of New York, Mr. Geo. G. Duffie, of Alabama, and other writers of prominence. Mr. Orange Judd adds a chapter from his individual experience.

Indiana Farmer, (Indianapolis, Ind.)

The topics treated are only those legitimately connected with the subject, yet they cover a wide field, and will prove of great interest to all occupied in the culture of the soil, while as a guide and a hand-book to those who keep one or more family cows, it must be of almost daily practical use.

Republican (Lansing, Mich.)

NEW SERIES—No. 407.

IN THE WOODS IN WINTER. — Drawn and Engraved for the American Agriculturist.

In many parts of our country the woods are scenes of great activities during the winter months. It is at this season that most of the logs for lumber are cut in the great pine forests of Maine, Michigan, and some other States, and afterwards drawn to the frozen streams, where, when the ice breaks up, they go down on the "drive," and are finally made into rafts to be floated to the mills. The life in a lumber camp is a peculiar one, and to the stranger is full of novelty. The ring of the axe, the shout of the teamster, the crash of falling trees, and the roar of the logs as they are shot down the river banks, all give, to the person unaccustomed to the clearing of a heavy forest, a strange sense of destruction, and for the moment he looks upon man as the destroyer. Nothing changes the face of the landscape so much as the disappearance of a forest, and when this is accomplished in a few short winter days, it seems almost as if some giant

power had been at work: as if a whirlwind had passed, and the great trees had been swept away.

Even in the older portions of the country, where, perhaps, the sound of the pioneer's axe died away a hundred or it may be two hundred years ago, the "wood lot" is a busy place, and the seat of much of the winter's hardest work. There is the firewood to cut and draw—enough to last the family through a whole year—and a few logs of pine, or oak, or whitewood, to be drawn to the mill to furnish lumber for some new farm building, or to use in adding to or repairing an old one. There is no time like winter for doing this kind of work, and there is no labor on the farm that pays better to do in season than this. To get the year's firewood in the winter—saw and split it, and have it all well seasoned and snugly piled in a handy shed, by the time the settled weather of spring comes, is of the most importance. It is a great saving of

time in the busy days of spring and summer, when there are so many things that must be done then or not at all. There is a great economy of fuel in using dry wood, and it has an important influence on the temper and happiness of the household. Sizzling fire brands and soggy wood have no tendency to develop in either man or woman saintly characteristics. Dry wood, then, is not only a means of grace, but much cheaper than that which is cut fresh from the tree when needed.

The accompanying engraving gives a view of a wood-cutting scene in winter. The hunter, who appears to have been fairly successful, is just coming up, and so quietly in the soft, freshly fallen snow, that the choppers do not hear him or his speechless, well-trained dog. The four oxen having brought their heavy load to the top of the knoll, have paused for a breath before they are urged on, either to the wood-yard or to the neighboring saw-mill.

## AMERICAN AGRICULTURIST.

NEW YORK, DECEMBER, 1880.

## Hints for the Work of the Month.

[The Hints and Suggestions in these columns are never copied from previous years, but are freshly prepared for every month, from the latest experience and observations, by practical men in each department.]

The days grow shorter, and reach their shortest duration, while the evenings are longer and longer. The time is favorable for looking backward in thought. Fore-thoughts are good in their time, but after thoughts, though often less honored, are worth a great deal more for shaping the future.

**Account of Stock.**—The last few days of this month and often the first week of the next, if indeed a longer time is not needed, are spent by all careful store-keepers and shop-keepers, and business men, in "taking account of stock." The goods are overhauled and examined, and an accurate list made out, of all articles, oftentimes with the cost and the selling price, or the cost and the present value, compared in adjoining columns. Thus the balance for the year can be accurately made out. Farmers ought to do something of this kind. It is not difficult, and if they do not plan to do it now, Christmas will pass, and the New Year will begin before they do it, and then it will be put over until another year. It is very easy to catalogue horses, cattle, sheep, and swine, and other live stock, and to set a fair price upon them. It is not difficult to estimate the amount of fodder; and the bushels of grain and roots are already, in most cases, accurately known. But a farmer's wealth lies in good part in labor expended, which will bear fruit another year, and in the far off future, and no estimate of the proprietor's business standing will be a just one which does not take into account such items as these: "20 acres sowed to wheat and grass, dressed with 18 loads of manure to the acre—say at a cost for labor, seed, and manure, of \$700," "100 rods strip fence at \$125"; the former item being placed in the "account of stock"—the latter in the "expense account," the same as "interest on the investment," "insurance," "repairs," "painting," etc.

**What's the Use?**—Will it make fatter beeves? Will it make better wheat and corn? will it make more milk and butter? Perhaps not; and yet it probably will help to do all these. The farmer will see, after the second year: 1st, whether or not he is advancing; 2d, where he may make important savings; 3d, what branches of his business pay best, which cost the least labor, and make the best returns. The nearer a farm can be conducted upon sound business principles the better for the farmer.

**Live Stock.**—As the season advances the live stock require increased attention; not only are they more directly dependent upon our care, but they are subject to discomforts from exposure, which seriously interfere with the profit of keeping them. Of all our domestic animals the pig is the most sensitive to exposure to rough weather, poultry next, in this order: fowls, ducks, geese, and turkeys, the last often doing better when exposed than if sheltered. Next to fowls, cows, then, working oxen and young cattle; next horses, which are used, unused horses, and sheep. Of these last the long-wool breeds are most sensitive to cold storms and snow, but close-fleeced breeds will stand almost any amount of cold if they have enough to eat, sheds to go under, and shelter from driving storms of rain and snow.

**Horses,** if well fed, usually feel bright and lively in winter, and young horses are, for this very reason, more easily trained than when the weather and running at pasture makes them dull. Whenever horses are used so as to warm them up at all, blanket them as soon as they stand still, if only for two or three minutes, those two or three minutes are sometimes enough to give a chill, which may end in pneumonia, or other serious troubles. Grooming saves feed, and also promotes health in horses, and should never be neglected. It will probably pay even to groom boarding horses, and it will certainly pay the owners to stipulate that their horses should be groomed daily. Blankets, except mere "dust-

ers," are worse than useless in stables; they make the horse tender, and more likely to take cold when brought in hot. Litter very freely if you have the material; straw, leaves, swamp hay, etc.

**Gypsum in Stables.**—This article is admirable as a fertilizer upon clover, and an efficient absorbent of ammonia, and purifier of the air of stables. It is well to sprinkle it over the floor of both horse and cow stalls, as soon as they are cleaned out in the morning, and over the bedding at evening. When thus used, its effects are just as good, and probably better than when applied alone upon the land.

**Cattle.**—Store and dry cattle will go through the winter under dry sheds, and fed upon corn-stalks and swamp hay, but they will do much better, if fed a little grain and roots, and well sheltered. It is not necessary to give them the care needed by

**Milch Cows.**—These ought to be well fed, and cleaned by a card and brush, daily, if possible, otherwise twice a week. They should be milked up to within four weeks of calving. It is a great temptation to dry off a cow so as to save the labor of milking, and not alone will hired men do this, but the farmers themselves, generally, do it, and think that they save a good deal in feed and labor, while in reality, with young cows, they impart a habit of going dry early, which will last them as long as they live. The better milch cows are fed, the better return they give, but feed judiciously.

**Cotton Seed Oil-Cake Meal** is being largely used and is worthy of being fed more extensively. Cotton seed is used in the Southern States with good results. The meal should be fed mixed with bran and best on cut hay. A little corn meal added gives flavor and color to the butter. Rowen or well cured lawn clippings are the best feed for giving color to cream and butter in winter.

**Testing Cows.**—Upon not a few of the best dairy farms—and yet, perhaps, it would be truthful to say upon a few such farms, the milk given by each cow is weighed at each milking, and once in a while, as her turn comes around, the amount of butter she will make is ascertained. This, if continued through the year, gives results which will enable the farmer to pick out his best cows. Though the system seems accurate, it is liable to one serious fallacy; a cow which is apparently in perfect health will give in one year a much larger quantity of milk and butter than she will in another, for reasons that are as yet not well understood.

**Calves** which are to be brought up away from the cow should be removed from the dams as soon as dropped. They will never—hardly ever—attempt to suck even one another's ears, and if fed carefully will fatten equally well with those on the cows.

**Sheep** are peculiarly sensitive to good treatment. A good shepherd is always gentle among his sheep. Ewes which are to lamb early ought to be by themselves and have better care as their time approaches. Feed a few more turnips and give them a little more liberal sprinkling of corn meal and bran, or oil cake.

**Store Sheep** and rams should be by themselves, and let fattening sheep have regular feeding and be kept quiet, giving them a very small yard and an airy but dark shed, supplied with feeding racks and troughs: never feed them in the open yard.

**Pigs.**—Nearly double the feed will be required to keep pigs from going back, after really cold weather comes on—say, when the ground freezes. It is then best to kill at once. Every farmer ought to be able to kill and cut up his own pigs. Butchers are often very rough and brutal. This is not necessary. Many a farmer who kills his own pigs does so because he wants the job kindly and humanely done. He actually thrusts the knife as if he loved the victim. Feed soaked corn, that is, corn which is covered with as much boiling water as it will take up in 24 hours. This is better for either fattening or store pigs than coarse meal, unless the latter be thoroughly cooked.

**Poultry.**—Hens will lay up to Christmas, if they have warm quarters. A manure shed, where mixed manure throws off considerable warmth, and which is closed in, but well ventilated, is an excellent place for fowls. They are kept warm and comfortable, their droppings are all saved, going to

enrich the manure, and they keep on laying, often all winter. At noon feed, in open weather, soft food—that is, boiled potatoes mixed with bran and corn-meal, or something of the kind; at night give a good feed of whole grain, throwing down enough to toll them off the roosts for an early breakfast, unless thereby you will be feeding an army of rats all night. In snowy and frozen weather, feed three times a day, and give only what they will run after at each meal.

**Ducks.**—Train them to spend the nights on a compost or manure heap, under cover. They will lay earlier, and eat less, for they will be warm.

**Geese** need regular feeding. They do well on potato and apple parings, a little corn, and a chance to pick up scattered clover leaves and heads which fall from the fodder racks.

**Game Birds.**—It is well worth while to look out for game birds during severe weather, when the ground is covered with snow and ice. At such times many quails perish, and if buckwheat and oats or other small grains be thrown under the shelter of evergreens, or along the fence rows where these birds will find it; they will winter much better for this care, and will not be likely to scatter very far in the breeding season.

**Swamp Muck.**—If the season remains open, no better work can be done than getting out muck from the swamp to be exposed to the freezing and thawing of the winter. It is always valuable as an absorbent, and often contains much ammonia.

**Draining and Ditching** may be pushed forward so long as the season is favorable; in fact, there is no better time for such work.

**The Wood Lot.**—Work may be done here during the whole month. It is the best season to cut timber for building purposes and for fencing stuff. For fire-wood, the season is not of so much importance, and yet that which is cut early in the winter is better than that cut later.

**The Ice Crop** in every section of the country is becoming more and more important. The season may be as unfavorable for ice as the last, but that is hardly possible. Nevertheless, a prudent man will be prepared to lay in his ice as soon as it shall have attained half the usual thickness, or even less. The probabilities are that an enormous quantity will be secured this season. It is being applied to new uses all the time, and its consumption in both town and country is greatly on the increase.

### Notes on Orchard and Garden Work.

THE FARMER, because these Notes are under a separate heading from those which relate to the proper work of the farm, may think that they are not intended for him. If this catches the eye of any one who has this impression, we would have a word with him. Those who raise fruits and vegetables as a business, do not need us to tell them what to do. It is for the farmer and others, inexperienced in such matters, that we give these monthly hints. The fact that, take the farm houses throughout the country, their tables, as a whole, show a great lack of variety, cannot be denied. In many, fruits are regarded as a luxury, and choice vegetables are a rarity. We have long endeavored to show that there is scarcely anything in the way of fruits and vegetables that can not be had by any farmer in the land, in the greatest profusion, if but a little thought be given to it. We do not look upon it as merely gratifying the palate with a variety, but as a matter of health and comfort which concerns the whole household. We therefore ask the farmer when he looks over the paper and comes to "Notes on Orchard and Garden Work," not to suppose that these are intended for what are called "professional" gardeners and orchardists. They are made for the farmer and intended to show him that there is no art or mystery in producing the choicest gifts of the orchard and garden that he can not learn and practise.

### Orchard and Nursery.

**Apples.**—This has been a great apple year, and immense quantities have been shipped to various parts of Europe. This trade is now so well estab-

lished that in planting, the American orchardist should have the foreign demand in view. Apples for shipping should be those that bear transportation, and also those that are in favor abroad, such as the Newtown Pippin, Spitzenberg, Baldwin, etc.

**Fruit in the Cellar.**—When the fruit cellar is separate from the house it should be kept just above the freezing point; such cellars do not require ventilation. Cellars under living-rooms must be ventilated, otherwise the gases given off while the fruit is ripening—and too frequently decaying—will endanger the health of the inmates. There is a demand for special care in this matter, at the present time, because the fruit has been so abundant that there is an unusually large amount stored in the cellars. If the house is so constructed that an opening can be made from the cellar into a chimney, ventilation may be very complete; an opening which can be closed at pleasure should be made to admit air from without when desirable.

**Cions** should be cut early and before they have been exposed to hard freezing; select the most vigorous and well ripened shoots; tie in bundles, label and pack in fresh sawdust, damp, as it comes from the mill; this leaves no grit to dull the knives when grafting, as is the case when sand is used. In the absence of sawdust pack in sand.

**Pruning**, unless very large branches are to be removed, may be done at any time after the leaves fall, when the weather is pleasant. This is a good time to bring young trees into proper form.

**Tent Caterpillars.**—Much time may be saved and vexation avoided by examining the orchard for the eggs of the Tent Caterpillar. This may be done on mild dull days during the winter. The eggs are glued closely together in a band around the smaller twigs as shown, near their ends, in the engraving. The burning of one of these clusters means the destruction of three or four hundred of the "worms" that otherwise would come from it in the spring about the time that the leaves start.

**Seeds** of fruit and ornamental trees are best kept in sandy soil or slightly damp sand, and so cool that they will not germinate.

**Animals.**—Winter is a trying time for young trees; the storms of wind and snow bend and break them. But perhaps the most serious injury is done by mice and rabbits. Clear away from around the trees all rubbish that may harbor mice. With young trees place a mound of earth (as in fig. 1) a foot in height around each, and tramp it down. This serves to support the tree against winds and keep away the mice. Rabbits are more destructive than mice. They have a great distaste for

1.—TREE EARTHED UP. 2.—A LATH PROTECTOR.

flesh and blood, and by rubbing the trunks of the trees with cheap meat, or smearing them with blood by means of a swab, the trees may be effectively protected. A good protector is made of lath fastened together with wire, and the whole bound around the base of the tree, as in figure 2.

**Manures.**—By many the orchard is expected to yield two crops—one from the trees, and another more directly from the soil, as it may seem. It is, useless to expect the best fruit from trees that are

robbed of their nutriment by quick-growing crops. Ordinarily, when the trees come into bearing, they should have the land to themselves. If circumstances make it necessary to grow some crop between the trees, both the crop and the trees should be manured. Well rotted manure is best, and when spread let it cover the whole ground and not be heaped about the trunks of the trees where there are no small roots to make use of it. Winter is an excellent time to spread the manure, as it can be drawn upon sleds which more readily pass under and among low trees than a wagon. A dressing of lime will often be of great benefit to an orchard.

### The Fruit Garden.

There is but little to be done in the fruit garden, except to finish up fall work and go into winter quarters. Mild days will give an opportunity to finish pruning currants, grape vines, etc., at the same time saving any of the wood that may be needed for propagation.

**Winter Protection.**—Many plants are killed by too much protection. For example, strawberries are hardy, and the covering of straw, marsh hay, etc., that is recommended for them is not so much to shield from cold as to prevent frequent freezing and thawing of the soil. The covering should be mainly around and not upon the plants.

**Shrubs** that are not quite hardy do not require bundling up, as was thought necessary not many years ago, when more plants were smothered than benefited by the covering. A little brush, or better, some evergreen boughs placed close to the shrub will ward off the severe winds, modify sudden changes of temperature, and be a sufficient protection. Tender raspberries must be bent down, and covered with earth before freezing prevents it.

**Manure.**—Coarse manure may be applied around currants, gooseberries, blackberries, etc.; in the spring rake off the straw and fork in the rest.

### Kitchen and Market Garden.

If the autumn has been prolonged, and the weather is still open, much work mentioned in the October and November Notes may be done now.

**Celery**, while in trenches for the winter, should not be allowed to freeze hard—a moderate freezing does no harm. The hay or straw for covering should be at hand when needed. As soon as the winter fairly sets in, the covering, which until then was slight, should be made about one foot in thickness. Celery in boxes, in the cellar, is more apt to suffer from heat than cold. The boxes, about nine inches wide, are made of old stuff, and as long as convenient; set the celery in them as in trenches. The boxes should be placed their own width apart, thus avoiding a solid mass of celery which would heat and decay. The cellar should be as near the freezing point as possible.

**Cold Frames** will now need daily attention. The plants kept in them are not to grow, and should they start they would be ruined. The sashes are to be kept continuously closed only during the coldest winter weather; at all other times, especially during the day, they must be lifted. When the temperature of the atmosphere is above freezing, the sashes should be off altogether.

**Cellars** where roots are stored need to be kept cool, otherwise the roots will shrivel or start into growth, and be injured. Roots for table use, if kept in earth or sand, are fresher and better than others.

**Parsnips** left in the ground are improved in sweetness by freezing. They can be dug during a thaw.

**Salsify** is also hardy, and may be left in the ground with the same treatment as Parsnips.

**Horseradish** may be dug before the ground freezes, and stored in a box of earth in the cellar. If a heavy covering of straw is put over the bed, the roots may be dug at any time during the winter.

**Seeds.**—The garden seeds should be assorted, labelled, and stored in a dry cool place, out of the way of mice. Seeds, like the parsnip, that are not good after the first year, should always be fresh. If there is doubt concerning any seeds, throw them away; use only good seed, and of the best

varieties; these precautions are among the prime essentials of good success in the vegetable garden.

### Flower Garden and Lawn.

Only the most thoroughly composted manure should be used upon the lawn, and even then the seeds of some weeds will probably not be killed. In respect to weed seeds, there is no risk to be run in the use of artificial manure upon the lawns. Heavy falls of snow may do much damage to trees, especially the evergreens. The snow should be shaken from the limbs before it gets hard and icy. When deep snows drag down the lower branches, the shovel should be used in removing the load

A CHEAP SNOW PLOW.

that might break them. A snow plow should be at hand. Where there is a long path, a horse snow plow is a great saving of labor. The one shown in the accompanying engraving is easily made. Always follow the established paths with the plow, and if there are places where strangers or thoughtless persons will be apt to "cut across," put up guards of wire. When the ground is covered with snow the birds should not be forgotten; provide both food and water for them in suitable places.

### Greenhouse and Window Plants.

*Chrysanthemums* that have flowered should be cut down and the pots placed in the pit or cellar, and left for a time to rest without water.

*Bulbs in Pots* should now be well rooted, and brought out of the cellar for early blooming. It is better to bring a few forward at a time, at frequent intervals, in order to have a succession of flowers.

*Hanging Plants.*—To water them perfectly, plunge the baskets into a tub of water, and let the earth soak; after dripping has entirely ceased, they may be returned to their places.

*The Temperature* of a greenhouse is much easier regulated than that of a living-room. The thermometer should stand at about 70° in the day time, and may descend ten or fifteen degrees during the night. This temperature is best for most persons.

*Dust.*—Plants ought to be covered with a cloth or newspapers when sweeping is being done. Smooth and thick-leaved plants, as Ives, can be sponged, which will add to their health and beauty.

### Valuable New Books.

Some new volumes advertised elsewhere are specially intended for our great family of readers.

**FARM HOMES IN-DOORS AND OUT.** By E. H. Leland, contains a vast amount of useful information communicated in an attractive narrative style. The table of contents, printed on third cover page, conveys an idea of the scope of the work. A copy should be in every family. The book is elegantly gotten out, on tinted paper, in black and gold binding, and will make a most suitable holiday present.

**BAILEY'S BOOK OF ENSILAGE**, published last year, has attracted considerable attention. The price (\$2.00) has been so high as to prevent its general circulation. The new volume is supplied at the popular price of \$1.00. It contains all the ensilage matter of the first \$2.00 edition. Those wishing to familiarize themselves with this method of preserving green fodder will find the desired information in this volume.

**WHEAT CULTURE.** By D. S. Curtiss, conveys hints and suggestions to farmers as to how they can double the yield and increase the profits.

**BARN-PLANS AND OUT-BUILDINGS** is a volume for which there has been much demand. The book proposes to give the desired information concerning the economic erection and use of all structures which the farmer may require. It is furnished at a popular price.

## A Special Favor Asked.

**1.**—There are about **42,000** different Post Offices in this country, to a large portion of which this journal is mailed regularly, to subscribers. Besides these, it goes to many other points in almost all parts of the habitable world.

**2.**—A *separate* book account, with alphabetical index, must be kept with each and *every* Post Office, whether it receives one, five, or five hundred copies of the paper, and the names of subscribers received in different letters, must all be *brought together* in the proper place in these mail books.

**3.**—As this is a great work, requiring the care of experienced, careful clerks, it is very desirable to give them every facility, and all the time possible. It can be best done if begun the moment this number is mailed, and not crowded into a few days and nights, about new year's day.

**The Special Favor Asked is, that each reader will, on seeing this paragraph, at once send in his or her own renewal for volume 40 (1881), and also the subscriptions of any friends who may be disposed to join our family of readers for the coming year. It will take no more time to do this now, than later on, and will greatly help us.** (A Subscription Blank is furnished on page 532.)

**Extra Copies for 10 Days.**—We shall print an extra edition of this number, and any new subscribers for 1881, whose subscriptions are received *prior to December 10th* will have this December number free. This applies to *all* new subscribers, premium clubs included.

**For the Whole Country.**—As to the real work and scope of the **AMERICAN AGRICULTURIST**, it "knows no North, no South, no East, no West," as separate fields of investigation. While the principles of cultivation, of plant growth, of home comforts, are the same everywhere, the world over, the Editors will hereafter, more than ever before, travel through various parts of the whole country to study the wants and methods resulting from the local differences in soils, crops, climate, implements, customs, etc. None of them reside in the city, but all have their country homes, and speak and write from actual experience and observation.

### WELL WORTH LOOKING AFTER.

The **331** numbered Articles, and the hundreds of *good* Books offered to our readers in the Premium List were selected with great care, and there are some things at least that are just what every Reader will desire. The terms on which they are offered make it easy to secure them by **ANY ONE**, at little or no cost. The quality of every article is vouched for, and one runs no risk of deception. We would like to have every reader look through the List again at this time. Read in the introduction, page 377, "Premium Giving Explained." If the copy sent in September, amid the political excitement, is lost or mislaid, another copy will be promptly sent on postal-card application.

### Giving Holiday Presents is Pleasant.

A notice to a distant son, to a relative, a workman, a friend or neighbor, that you have ordered the *American Agriculturist* for him for 1881, will be to very many a most acceptable gift, and one that will be a reminder of you every time it comes all through the year.—Then there is a fine assortment and great variety of excellent things described in our Premium Sheet, most suitable for Holiday Presents. If one can not obtain them free, by means of premium clubs, they will be supplied to any of our friends at the prices named; if they will send in in time.

**Be in Time, if for Christmas or New-Year's.**—Our Friends intending to receive, either by subscription clubs, or by purchase, any of our Premium Articles for themselves, or to use as Holiday Presents, should send in ample time for the Publishers to secure them. Some articles, in unusual demand, may chance to run short in supply early in the month. Accidents, or over-crowding, or other delays in transportation, may happen to bring some desired articles along "a day after the fair," if not started early.

**Did You Notice** the easy method of getting, at almost *no cost*, an excellent supply of *good* Books for yourself, or for a neighborhood circulating library, etc., as offered in our Premium List? This offer embraces not only books on Agriculture, Horticulture, Gardening, Architecture, Animals, Plants, etc., but many of the best Standard Books in all departments of Literature. Any person or company of persons, by collecting and sending in ten or more subscriptions for 1881, at the regular rate of \$1.50 each, can, for *each* of the ten or more names, select *one dollar's worth* of books (any ones desired) from the hundreds of volumes named in the Premium List. Please refer to that List, or send for a new copy if yours is mislaid.

**67 per Cent!**—As the *American Agriculturist* will surely be worth the \$1.50, the books obtained under the above arrangement will be equivalent to 66% cents *extra* on every dollar invested.

**Union Books.**—If some one will be enterprising enough to start the work, it will be an easy matter to find, in *any* neighborhood, from ten to a hundred persons who will contribute \$1.50 apiece for which *each* will receive this paper a year, and *besides*, there will be \$10 to \$100 worth of good books, which can be kept by one of the number, and circulate among the subscribers until all have read them, and then they can be kept together for reference or re-reading whenever desired by any one.

**Is there Any Doubt** that it always *pays* to read about what *others* do and say, and think, who are in the same line of business or work as ourselves. If one does not at first get direct information specially and at once applicable to his own work, yet the thoughts and methods of others incite new thoughts and plans in the reader's own mind that lead to profitable results. The reading, thinking man, makes his head help his hands. Brains tell everywhere, and in nothing more than in farming, gardening, and housekeeping. And the fewer brains one has, or thinks he has, the more anxious should he be to get from books and papers all the facts and suggestions he can from other people's thinking and experience.

**Every German Cultivator and Laborer on the Farm, or in the Garden, and every German Family not reading English, OUGHT** to have the German edition of the *American Agriculturist*. It contains not only the Engravings, and all the essential reading matter of the American edition, but an additional *Special German Department*, edited by the Hon. Frederick Münch, of Missouri, a skillful and successful cultivator and excellent writer. No other German Agricultural or Horticultural Journal in America has been so long issued; no other one contains so much useful information, or a title of its engravings. Indeed, we recall only one other German professedly Agricultural Journal in all this country. The Germans are a reading, thinking people, and know how to make good use of what they read. Many supply this edition to their German laborers and gardeners, and all would find it pay to do so.—Nothing else can compete with it in cheapness of price for the same amount of material, engravings, etc., because the expense of providing all these is largely borne by the edition in English, and no separate office or machinery is required beyond German editors and printers. Its terms are the same as the American edition, singly and in clubs; and clubs can be composed of subscribers for either edition, or a part of both.—Please call the attention of your German neighbors to this paper. It will do much to help new comers to a knowledge of the system and modes of culture used in this country.

**Save the Index.**—It is printed on an extra sheet, and put in loosely, so that it can be bound or stitched in

front of the year's numbers, for ready reference.—By the way, a glance at this sheet will show how great a number of topics have been talked about, and illustrated in this single volume. The next Volume will be quite as full mainly of fresh hints and suggestions, etc., with new, larger type in the body of the paper. No one, we think, will exercise wise economy if he fails to secure every number for 1881.

**Bound Copies of this Volume** (39) will be ready on or before Dec. 10th. They are in the uniform style, cloth, with gilt backs. Price at the office, \$2. If sent by mail \$2.30. We can supply, at the same rate any of the 23 previous volumes, or from volume 16 to 39 inclusive. *Any ten or more volumes, in one lot, will be supplied at the office for \$1.75 each; or be forwarded by mail or express, carriage prepaid, for \$2 each.*

**Binding.**—Sets of numbers sent to the office will be bound up in our regular style for 75 cents per volume, with 30 cents additional if to be returned by mail. Any missing numbers supplied to complete volumes at 12 cents each. The prepared covers, ready for inserting the numbers by any bookbinder, sent by mail for 50 cents each.

**About Club Subscriptions and Rates, etc.**—Every P. O. receiving papers, whether one or a dozen, must have a separate Book Entry, and a full wrapper and address. If three, five, or ten papers go to the same office, they all go under the same entry, and under one wrapper and address, with a simple slip on each giving the subscriber's name. Every added name diminishes the proportionate cost of each, for time and wrappers, throughout the year. Again: In all business, "wholesale" rates for increased quantities are lower. Lastly, the lessened cost is an inducement to subscribers themselves to enlarge the number. So, while for this Journal, with its superior printing paper, its many engravings, requiring slow careful printing and frequent washing of plates, its careful editing, and the number of experts required for accuracy where there are tens of thousands of varieties of plants, fruits, animals, insects, implements, modes of cultivation, etc., \$1.50 a year is a low rate. Yet experience has shown that a scale of rates can be adopted like this: "One or two subscribers, \$1.50 each, Three subscribers, \$4 (\$1.33 each), Four for \$5, five for \$6, and so on, until ten is reached, at and after which the lowest possible club rates of \$1 each is adopted, and must necessarily be adhered to.—Yet Clubs may be increased with advantage to the subscribers. Any one forwarding a club of say four at \$5, or \$1.25 each, may add other names at the same rate if to begin at the same date. But when several additions are made by the same person, the whole may be reduced to him to the rate for a larger club. Thus, if he has sent four at \$5, he can send six more for \$5, that is ten in all, for \$10.

N. B.—The above scale of rates has nothing to do with the giving of Premiums. The premiums are a separate matter; they are paid for out of advertising receipts, on the principle that by securing enlarged circulation they thereby increase the value of advertising space, and bring more receipts out of which to pay the premiums.

containing a great variety of items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of room elsewhere.

**Distribution of Carp.**—Since the publication of the illustrated article on the European Carp, in January last, we have had a multitude of inquiries as to the method of distribution of this valuable fish. Upon a recent visit to the Fulton Market, in this city, we saw, at E. G. Blackford's stand, a large tank filled with upwards of a thousand young carp, about three months old. Mr. Blackford is State Fish Commissioner, of New York, and these carp have been received by him from the United States Carp Pond at Washington, and are for gratuitous distribution throughout the State of New York, to persons having suitable waters for growing them. A pond with a muddy bottom is preferable, that there may be an abundant growth of plants during spring and summer. The carp are vegetable feeders, and should be the only fish occupying the pond. Applications for these fish are to be made to Mr. Blackford; the largest number supplied to one person is five pairs. Those who send for the Carp must provide the requisite cause for their transportation.

**Exports of American Apples.**—Reference is made elsewhere to the unusually large shipments of our apples to European ports. When informed a few weeks ago in Covent Garden Market that there were at that

time 13,000 bbls. of American apples on sale in London, the quantity seemed so large that we feared there might be some error in the figures. Recent interviews with some of our shippers show that the figures far exceed anything we had supposed. We learn, from reliable sources, that up to Nov. 3d, 280,000 bbls. of apples had arrived at Liverpool. It was estimated that, at the above date, at least 100,000 more bbls. were on the way. That there had been received at London, Glasgow, and other ports, 200,000 more, making a total of 580,000 bbls. of apples exported up to the first week in November.

**Guinea Grass.**—In an account of this grass, in March, 1877, we indicated that it had become thoroughly naturalized in some of the Southern States, the result of early experiments in its cultivation. "L. A. B., Little Rock, Ark., sends an extract from the 'Memoirs of the Philadelphia Society for Promoting Agriculture,' 1814, which shows that the Guinea grass was cultivated in Jefferson Co., Ky., by Jos. B. Oglesby, at that early date. Though Mr. O. is quite as enthusiastic as to the great value of this grass as are some of the present writers, claiming that it yielded "ten times as much as timothy," it does not appear to have made much progress. Both this and the Dnra have been cultivated since the early part of the century, and though they are brought forward at intervals, they for some reason fail to make themselves a place among the regular farm crops. Mr. B. kindly quotes the remarks of the Editor of the "Memoirs," on the botanical relations of the grass, which shows that he knew but little about it. The accepted botanical name of the grass is *Sorghum Holcense*.

**Locust Trees from Seed.**—"W. S. U." Myerstown, Pa. The better way is to sow the seed in a seed-bed, and transplant the young trees when one, or better two years old. Spring is the proper time; pour scalding water upon the seeds, and when cold sow them in light rich soil, dropping them 6 or 8 inches apart. Keep the bed clear of weeds during the summer.

**Learning Phonography.**—"W. B. W." The fact that Mr. Chaffee, of Oswego, N. Y., has an advertisement in our columns shows that we have been satisfied that he will do what he proposes. That he can surely teach you or any other person to become an accomplished phonographer, does not depend upon the teacher alone. The scholar is an important factor in that problem. Your best course is to correspond with him rather than with us.

**History of the Mass. Horticultural Society, 1829-1878.**—Boston: Published by the Society. This handsome volume of nearly 550 pages, while full of local interest, has a value to every horticulturist in the country. Being, with the exception of that of Pennsylvania, the oldest society of its kind, its history must be in good part the history of American horticulture. Perhaps the most valuable portion of the work is the sketch of the History of Horticulture in the United States, previous to the founding of the Society, which brings together much concerning our early history that will interest those who are not horticulturists. Though his name does not appear upon the title page, the completeness of the work is due to its Editor, Robert Manning, the present Secretary of the Society, who possesses the industry and appreciation of the necessity for accuracy that eminently fit him for the task. A portrait of the first President, Gen. H. A. S. Dearborn, and views of the present and former halls of the Society embellish the volume. The work was published by subscription of the members of the Society, but we learn that the Secretary can supply a limited number to others at \$3 each.

**Barrel Cart Again.**—"R. C. J., Opelika, Ala., writes: "I was interested in your cart shown in the Oct. No., for hauling barrels and tubs of slops for hogs and cattle. I have one which I have been using since 1860, which I think is much more convenient and cheaper. I use a pair of buggy wheels, with the axle shortened, so as to barely let a barrel, set on end, pass between the wheels. I then fasten the shafts to the axle, letting them extend beyond it far enough to pass under an iron pivot on each side of the barrel. The pivots rest in a notch on each shaft near the end, so that when pressure is applied to the long ends of the shafts, the barrel will be raised up and still keep perpendicular. One of the great advantages of such a cart is, that it can be so easily attached to different tubs or barrels. The length of the shafts is in proportion to the size or strength of the man or boy who is to use it."

**Millet for Name.**—"J. O. K., Kearney, Neb. The specimens appear to be of that variety of Hungarian Millet which was introduced a few years ago as "Golden Millet." It has been tested to some extent as an annual grass, and has been highly spoken of as giving a heavy crop of hay, which, though coarse, is much relished by farm animals. It is cut soon after flowering, and long before the small, globular grain matures. The seed is

produced in great abundance, and affords food for poultry and pigs. Horses are fond of the grain, but we should not feed it to them, as the rough bristles that accompany the grains have sometimes been injurious.

**Keeping Peas and Beans.**—"S. A. C., Millidgeville, Ga., writes: "I have observed from time to time complaints of the difficulty of preserving peas and beans from the weevil, particularly in the South. Your subscriber, several years ago, found an effectual means, and I give it for the benefit of those desiring to keep their peas and beans free from weevil. Harvest and dry the seeds thoroughly in the sun, and then place them in jars, cans, or barrels, which have been heated before the fire, deposit in the vessel a bottle of turpentine, not corked, but simply closed with a piece of cloth. Expose the vessel now and then to the sun, keeping it closed as near air tight as possible. The fumes of the turpentine kill the larvæ of the weevil that have hatched from eggs deposited when the seeds were green."

**Apples and Milch Cows.**—Sweet apples do not hurt milch cows, unless fed in too large quantities. Many sour apples certainly decrease the flow of milk. A few do not seem to hurt either the cows or the milk.

**Shut Out Cold and Save Fuel.**—A narrow crack or opening by the side of, or under, a door or window, will let in more cold air during winter than a ton or two of more of coal will warm. Besides, a draught, however small, is productive of colds. A strip of listing, or a weather-strip put on, will save fuel largely, as well as save health. Weather strips are now very common. Those consisting of a strip of wood and rubber are good when easily obtainable. A new form, introduced last year, is very convenient for sending anywhere by mail. This is a narrow rubber sheet curved over to form an elastic cushion, *a*, and its edges are sewn to a strip of thin tin, as shown in the engraving. Fig. 1 gives a small size. Fig. 2, of double size, shows the form better. Small tacks, driven through the holes in the tin at every two or three inches, fasten these strips against the edge of

a door or sash. The elastic rubber cushion, *a*, closes the opening, but allows the sash to be raised or lowered. It comes in lengths of 25 and 50 feet, coiled as shown at the right-hand, figure 3, so that it can be mailed at a cost of half a cent per foot on pre-payment of postage. The price is about 5 cents a foot, or 5½ cents, if sent by mail. Our readers who cannot obtain it elsewhere, may send to this Office, and we will procure and forward what they may desire, in even lengths of 25 or 50 feet, at the above prices. This is for the best half-inch-wide kind. There is a cheaper kind, which may answer for temporary use a season or two, supplied at one cent less per foot. The size shown in fig. 1, answers for both doors and windows. A narrower strip that will answer for windows, costs 4 cents per foot, or 4½ cents if sent by mail.

**"Curious Plant."**—"D. D. R., Polk Co., Minn., writes: "Enclosed find seed and fibre of a curious plant found here. It grows about three feet high, and has several bulbs resembling those of the cotton plant, and has a good handful of fibre in each bulb. What is it? When found they had burst open and the cotton was protruding. Only three stalks have been found, and they were among bushes under the trees, and were probably some chance dropping of the birds."—The seed and fibre is that of the Common Milkweed (*Asclepias Cornuti*). This is a common plant in rich ground almost everywhere, and is counted a troublesome weed in some localities, and one exceedingly difficult to eradicate. The flat seeds, contained in large pods, are provided with a copious tuft of silky hairs, which serve with the aid of the wind, to distribute them. The "fibre" has no textile value.

**Lucern or Alfalfa.**—"A. L. F." asks if it can be grown in New England. We know that it is cultivated with success near Boston, where the winters are quite severe. The seed is kept by all the seedsmen.

**The Death of R. F. Johnstone.** Editor of the *Michigan Farmer*, took place in Detroit, on the 24th of October last. Mr. J., a native of Ireland, came to this country in his youth, and for the last thirty years had been an active promoter of the agricultural interests of Michigan, both as an Editor and as Secretary of the State Agricultural Society.

**Shirt Bosoms and Collars.**—We are again asked how they are done up at the laundries, as they have so much better polish than can be produced at home. We looked up the matter several years ago, and learned from the proprietor of a large laundry that the polish was entirely due to hard rubbing with a "polishing iron." This iron is shaped like a common flat-iron, but without corners, as shown in the engraving here given, and it has a smooth and very brightly polished steel face. Such polishing irons can be had at the city

A POLISHING IRON.

furnishing stores. The linen is starched in the usual way and ironed. Some use a little gum arabic, others spermaceti, and others nothing. The ironed bosoms and collars have a damp cloth passed over them and are then pushed by the use of the iron mentioned, the ironer hearing on hard and rubbing the surface of the linen rapidly.

**Black Walnut Stain.**—A few years ago we gave directions for staining pine or other white wood a brown color, somewhat like black walnut, by the use of umber. We have since found a much better method. Dissolve an ounce of Catechu in a quart of boiling water, adding a lump of Sal-Soda the size of a hickory nut. Dissolve an ounce of Bichromate of Potash in another quart of Water. The articles are not expensive, and may be had at any drug store. To stain the wood-work, first paint it over with the solution of Catechu and allow it to dry; then go over it with the solution of Bichromate. When thoroughly dry a coat of Shellac or other varnish will bring out the grain of the wood. The solutions may be made stronger or weaker according to the depth of color desired. Picture frames, book-cases, and work made with the scroll-saw from very common material, may be thus treated with most satisfactory results.

**Look Out for the Water Pipes.**—A friend who at much expense introduced water into his country house remarked to us: "Ever since I have had water I have had trouble." Unless a house is warmed throughout there should be provision for shutting off the supply and letting out the water which remains in the pipes. The waste pipes also need looking to, for whenever water freezes in a pipe there will surely be a leak. Where water pipes are in daily use there is seldom much danger of freezing except during the night. Such pipes, where exposed, should be protected by wrapping with old carpet or encased by a box which may be filled with leaves. If circumstances admit of it the water may be allowed to run slowly during cold nights. Rats often cause much trouble by gnawing lead pipes. Some say that this is to get at the water, but others claim that it is merely rat-nature to gnaw whatever will yield to their teeth. Whatever may be the reason for this gnawing, it should be kept in mind as something likely to occur.

**Chilblains.**—It is not necessary that the feet should be actually frozen to produce chilblains. Children often suffer intensely from this cause; after playing out doors in the snow and getting their feet very cold they come into the house and warm their feet by the fire. These sudden changes produce an unhealthy condition of the skin of the feet, the proper circulation is interfered with, and there is intense itching and burning. The following was a popular chilblain lotion some years ago: Sal-Ammoniac  $\frac{1}{2}$  oz., Water 1 gill, Alcohol  $\frac{1}{2}$  gill, and Muriatic Acid 1 dram. We have seen the application of Kerosene highly commended for painful chilblains, but have not had occasion to try it.

**Lime for Fertilizing.**—"A subscriber of many years standing" asks: "In applying Lime to land for fertilizing purposes, is it best to use it in the caustic state, or after it has been slaked with water?"—As lime comes from the kiln it is known as caustic or quick lime, the heat having expelled the carbonic acid gas of the carbonate of lime, or limestone. By exposure to the air, and moisture, water and carbonic acid gas are absorbed, and the caustic lime returns to the carbonate. While this change is going on the lime has the power of decomposing vegetable matter, and setting the elements

of plant food free: this is the chief value of lime when applied to a soil. It is therefore clear that the larger the per cent of the lime that is in the caustic state, the more efficient it is, and the quicker the lime is applied after burning, the better. Lime is largely a secondary fertilizer.

**"Tom Brown," and the New Rugby.**—Probably no work for young men has been more generally read on both sides of the Atlantic than "Tom Brown at Rugby," in which the author, Thomas Hughes, gives an account of his life at the celebrated English school at Rugby. The author, now a member of Parliament, is greatly interested in the welfare of his countrymen, and identified with coöperation and other schemes for the benefit of working people. He hopes to benefit farmers by aiding a portion of them to leave England and go where there is more room and land is readily acquired. As the head of a company for this object, Mr. Hughes has recently been in this country to establish a colony on the table lands of Tennessee, which is now fairly started and is called Rugby after the English town. We regret that we were unable to accept an invitation to attend "the opening of the town site" which took place on the 5th of October last. The chief feature of the exercises was a most sensible address by Mr. Hughes himself. Though started for the benefit of colonists from England, others are not excluded if they will accept the conditions of admission. The enterprise is in no sense a charity; the title "Board of Aid to Land Ownership," indicates its object, which is to assist those who have some means to invest them in the best manner. The Post Office address of the new settlement in Rugby, Morgan Co., Tenn.

**Sweet Corn—Quick Returns.**—"W. F. W.," Bridgeton, N. J., writes: "I had for dinner last week some sweet corn, which grew from seed that was raised this year. It was of the excellent 'Early Minnesota' variety, the first planting of which was on the sixth of April; the seed from this first crop was planted and gave the supply referred to."—We have long regarded the "Early Minnesota" as one of the best of the very early varieties of sweet corn, which does not appear to be as generally known as its merits deserve, and we shall be glad if this double crop of "W. F. W." serves to call attention of lovers of Sweet Corn to this excellent variety.

### Sundry Humbugs.

In England coöperation and coöperative stores have been long enough established to show that they are most excellent institutions. Similar stores have been started in this country, but from one cause or another they have not been so successful. The principle is a good one, but success depends upon its application and the manner in which the details are carried out. Recently the matter has been revived in this country, and Mr. Thos. Hughes, M.P. (better known as "Tom Brown of Rugby"), on the eve of sailing for home last month, gave a public address in New York City on Coöperation. It is likely that coöperation will now take a new start and, avoiding former mistakes, stores will be established at which those who coöperate may make a considerable saving. There is nothing so beneficent but it may be turned to bad uses, and there is no place in the country where new schemes of fraud are hatched more rapidly than at Cincinnati, Ohio. No sooner is coöperation revived than there comes from Cincinnati, O., the prospectus of a

"CO-OPERATIVE COMMERCIAL AGENCY."

This concern mails circulars to perfect strangers, asking them to act as agents! One circular says: "Your duties will be to make reports when called upon, to collect accounts and negotiate loans." But before one can be qualified to do this, he must subscribe to the "Commercial Reporter," price \$2 a year, "invariably in advance," and it is also very desirable that the agent aforesaid should send \$2.50 for a tin sign, in order that signs may be "uniform" you know. In all \$4.50 to start in the business of coöperating. As a bait the following is hung out: "We may (if you become our agent) be in a position to serve you personally upon advantageous terms with any loan your business may require, or secure you a partner with money, or sell your property for you, and grant you many other favors." When we would learn who is to do all this, we find that it is

"RESPECTFULLY, CO-OPERATIVE COMMERCIAL AGENCY."

If we would know where to find the "Agency," we look carefully over the various circulars; while these are very full on the subject of tin signs at \$2.50 each, we

find that no other address is given than "Cincinnati, O."—Here is a concern, which claims to have a capital of "Two Hundred Thousand Dollars," without a local habitation! As we look back at Cincinnati, we see in memory looming up through the dim past a "Secret Service Company," that required that "detectives" should subscribe to a \$2 paper—but we do not remember any \$2.50 tin sign. This coöperation business will not coöperate any better than the "Secret Service," served. Common-sense people keep shy of all unusual ways of doing business....The Boston papers have of late been much concerned over

### "THE LADIES' DEPOSIT,"

which, whether it prove a fraud or not, may properly be placed under the unusual—very unusual methods of doing business. The papers are filled with column after column of fine print, all relating to this concern, which appears to have completely baffled all attempts at investigation. The office, in a richly furnished house, is managed entirely by women; single women, widows, or wives with invalid husbands can do business there. Deposits of not less than \$200 or more than \$1,000, are received, on which interest in advance is paid at the rate of eight per cent monthly. If any depositor wishes to withdraw, her money is paid at once, and she can do no more business at that shop. The parties concerned are not known to keep any bank account, and the whole is surrounded by mystery of the densest kind. Of course, Bostonians are most curious to know what kind of business it is that can afford to pay 96 cents for the use of a dollar for a year. The general impression appears to be that, at some time when the deposits are most abundant, the thing will suddenly stop, but it is merely a conjecture. The Boston papers, their reporters and interviewers have for once met their match in the three women who manage "The Ladies Deposit."... Several have written about

### SPECULATIONS OR COMBINATIONS IN OATS,

which have been going on for several years, particularly in Ohio. The oats in question are the "Hulless," or "Bohemian Hulless Oats," which are claimed to be a new variety that will yield 40 to 60 bushels to the acre and weigh 50 lbs. to the bushel. It is represented that there will be a great demand for these oats for seed, and "Associations" are formed to supply them. The members of the "Association" agree to take five or more bushels of the oats at \$10 the bushel, and sign an agreement not to sell for seed at less than that price, or in quantities less than five bushels. The projectors of the scheme vary the matter in different localities, but in all cases the farmer agrees to do certain things while the other party agrees to do nothing. In some cases the farmers gave notes (of course some people always will give notes), which were sold as soon as possible. A number of farmers in Medina Co., O., joined one of these "Associations," some of them finding it very difficult to raise the money to buy the seed at \$10 the bushel. Now that the harvest is over they find that the yield ranged from 6 to 20 bushels to the acre, of oats weighing about 40 lbs. to the bushel. Having this crop they are puzzled as to what to do with it. They have agreed not to sell at less than \$10 per bushel, but they do not find that any one has agreed to pay that or any other price. Our correspondent asks, 1st, "If these parties have exclusive control of the seed in the U. S.?" 2d, "If the oats have been tested and found profitable?" 3d, "What do you think of this manner of doing business?"—These are very sensible questions, but are put rather late. If those persons who have these high priced oats on hand had exercised ordinary caution, they could have learned that

### HULLESS OR SKINLESS OATS,

(Bohemian being put on for "grandeur"), have been known in this country for 30 years, to our knowledge, and probably much longer. So far from these parties having "exclusive control of the seeds," the oats may be had from the N. Y. seedsmen at a fourth the price the Ohio people paid. The oats have been tested many times, and have been found to deteriorate so in our climate, that no one has continued to cultivate them. As to this method of doing business, we think it a most profitable one for one party—the one that sells the oats. It is a curious fact that these Hulless Oats have come to the front every now and then for these last 20 years, and always connected with some such one-sided transaction.

### THE SPRING-BED CHAPS GOING SOUTH.

The spring-bed swindlers have heretofore operated in New England, but we now hear of them in New Jersey. A young man writes that a couple of these fellows induced his father to take the agency of the spring-beds. He was to take 18 beds, pay \$4 each, and sell them for \$10, and he "signed an agreement" to that effect. In about two months another came along with the paper, which turned out to be an agreement to pay \$10 each instead of \$4. The holder of this paper, by threats of law, etc., actually "scared" the father into giving a note for the whole amount, \$180! The son now writes us, asking if this note can be collected. We do not profess to give legal advice. We should judge, however, that

the case would depend on the evidence of fraud that may be presented at the trial, and how much of threatening was used to obtain the note. As a general rule such notes are collectable, if the parties who bought them of the swindlers, were themselves acting in good faith, without any collusion, paying their money for what they had every reason to believe were good notes. The makers of the notes should not have given out such notes. How often have we written,

"FARMERS, SIGN NOTHING FOR STRANGERS,"

no agreement, not even your address, if it goes into the hands of a stranger?... It is a long while since we heard of the "Powder to Prevent Lamp Explosions." It has been so thoroughly exposed that we supposed it to be quite dead. Here is a letter from Oregon, the writer of which asks where the Powder can be procured, as he wishes some. Years ago this was a very successful humbug. The peddler went from house to house, showing that when this powder was mixed with kerosene, he could thrust a lighted match into it, and the oil would not explode, and other such tricks. Not being aware of the fact that oil never explodes, but that it is the vapor of the oil that is dangerous, many have been deceived by these tricks, and supposed that the powder prevented an explosion. After a while a chap appeared, whose Powder not only prevented the lamp from exploding, but would also prevent the chimneys from breaking. A few years ago we procured some of this wonderful Powder, which, on examination, proved to be only

#### COMMON SALT COLORED BLUE,

which could have no more effect upon the oil than the same quantity of sand.... There has, of late, been a great dearth of new medicines, and a new one comes as a surprise, especially when it is "The only known Remedy for the Cure of Rupture"—which is claimed to be "as certain a specific in this dangerous and distressing affliction as Quinine in Malaria." Rupture is a mechanical trouble, which can no more be treated by medicine than can an in-grown toe-nail, and the thing need only to be mentioned to show its absurdity.... For several months we had heard nothing of the Battery business, but just now there come several inquiries concerning them. To these we reply in brief: We have examined all of these so-called "batteries" that have been extensively advertised. They are disks of the size of a half-dollar or smaller, made up of bits of different metals, and are intended to be worn next the skin, over the heart, etc., and great are the virtues claimed for them. We have not seen one of these that did not show

#### THE MOST UTTER IGNORANCE

of every law of electricity. It would be absolutely impossible for these to produce any electrical effect upon the body. Whatever cures they may have effected are entirely due to the imagination. As much benefit would result from the wearing of a leather medal, or carrying a horse-chestnut in the pocket, as some persons do to keep away rheumatism.... For the information of new readers we must add that we know nothing about any

#### DOCTORS WHO ADVERTISE THEIR CURES.

New York is a large town, and there is no better place for one to hide in than a great city. A great many obscure chaps advertise in distant papers of the wonderful cures done at their infirmary, hospital, or sometimes even "university" in New York, and propose to send out medicine to cure people at a distance. We are often asked about such "doctors." As a general thing they are quite unknown here and do their business through the mails. Our invariable advice is, to have nothing to do with one who advertises his cures or proposes to undertake a case without seeing the patient. The whole crew are unreliable quacks.

P. S.—Since the above relating to the Boston "Ladies Deposit" was in type, we have learned that a similar concern has been operating in New York as the "Ladies Mining and Stock Exchange." It proposed to receive deposits, use them in stock operations and return the depositor half the profits on the investment, and to always return the investment whether it made or lost. Like the Boston affair this was quite too good to last, and one bright morning early in November, Mrs. M. E. Warren & Co. did not open their "Exchange." Callers found a sign stating that "This office will not be open until Wednesday next at 10 A.M." On Wednesday there was a large crowd of depositors, but no Mrs. Warren, who appears to have "gone where the woodbine twineeth." Every sensible person knows that all unnsual, unbusiness methods of making money must always end in a collapse.

**Fowls for Eggs.**—"P. E. M., Columbus, Ohio. Light Brahmas hold on laying in very cold weather, perhaps better than White Leghorns, but on the whole Leghorns are the cheapest and best fowls for you to buy for eggs only. Do not think of hiring an acre of ground two or three miles away. It would be running great risks—you need to live close to your fowls. Begin on a small scale, and let the business grow with your knowledge of it, and with its own profit to a considerable extent. Start

with a dozen hens and one cock; nothing fancy—good healthy birds that look as if they might be pure White Leghorns, but be sure that the cock is pure. In a few weeks, if these do well, start another flock, but keep them apart. It may cost \$50 to \$75 to start in the way suggested, and within a year you will have gained experience to guide your future operations.

**Charcoal as a Fertilizer.**—"O. J. M., Penn ville, Ind., writes: 'Is charcoal a good fertilizer on clay soil? If not strictly a fertilizer, is it of any advantage? I have some old fields and a plenty of wood and could produce charcoal cheaply.'—Charcoal is composed almost entirely of carbon, is insoluble, nearly indestructible, though it may serve as an absorbent, is not in itself in any sense a fertilizer. When applied to heavy clay soil the mechanical effect of charcoal may be of value in making the soil more porous; but this end can be obtained by using sawdust, straw, and other coarse litter, much more readily than by converting wood into charcoal for this purpose. If the wood is to be disposed of, the quickest and best method to make it available as a fertilizer is, to burn it and spread the ashes upon the soil.

**A Kicking Horse.**—Mr. "T. M. C., Dnchess Co., N. Y., sends sketches and descriptions of a method

Fig. 1.—ARRANGEMENT OF PARTS.

of hitching a kicking horse to a double wagon. Fig. 1, shows the arrangement of the parts of the "frame" into which the "kicker" is fastened. A piece of wood A, C, 2 by 2 inches is made to fit behind the whiffletree and reach out as far as the outer trace. A brace, B, C, runs back from the middle of this, to the tongue bar. The kicking horse is placed inside the thills and harnessed in securely. It does not

Fig. 2.—PORTION OF FRAME.

take long for the horse to give up his bad habit when thus fastened down. A thill is bolted to this end. The arrangement of the frame is shown in larger view in fig. 2.

**A Heavy Clay Soil.**—"W. H. M., Mount Clemens, Michigan, writes: 'I have a piece of heavy clay soil. What shall I use to make it more mellow? Are ashes good on clay or should I use lime?'—Ashes are very good, if you have plenty; they will probably mellow up the surface, so that you can plow in a crop of clover, which will help matters very much. Your soil probably needs thorough draining more than either ashes or lime.

**Sorghum Seed, Etc.**—"G. W. K., Washington, D. C.—The seed of most grasses (and Sorghum is a grass) is highly nutritious. Its value depends upon the time at which it was cut, the degree of ripeness, etc. If sound, the seed may be ground and fed to any farm stock. The leaves of the sorghum, if not frozen and dried out so that they become unpalatable, are good food for horses and cows. So is the bagasse, or cane, after it is ground, provided it has not soured and heated.

**How to Treat Manure.**—"Agricola," of Massac Co., Ill., writes: "I would like to understand more fully the action of water upon the manure and litter taken from the stable and cow-shed. Should it be exposed to the rain, freezing and thawing of winter, or sheltered until spring? Would it have time to rot after the freezing weather sets in, and be in time for use on the corn-field?"—It would be much better to have the manure piled up under a shed, than exposed to the weather. Manure, to keep well, must be either packed by treading to exclude the air, or kept so moist that fermentation will not become violent and burn (fire) the heap. If exposed to rain and water much of value leaches out, and is lost. If kept under cover, there should be a tank at the lowest point, covered with rails, or a grating where liquids can settle, and be pumped up over the heap again. Add fresh water, if necessary, to secure moisture enough to prevent

burning. Such manure is in good condition in spring. The corn crop does not require rotted manure.

**Leached Ashes or Horse Manure.**—"A Reader," of Tiffin, O., is in a great quandary. "Which is the cheaper," he asks, "straw horse manure at 25c. per load or leached ashes at 10c. per load? Will it pay to draw either, making two loads a day when the teams have nothing else to do?"—The price paid has very little to do with the question. It is one of hauling. The horse manure can hardly be worth less than \$2 a load, and the ashes certainly 6c. a hushel. A load would probably be 40 bushels, which would be \$2.40. In one case the team would earn \$4, in the other \$4.80. The ashes would be best applied to grass and potatoes. The horse manure to corn or wheat.

**About the "Dentaphone."**—Two strong complaints, and many letters of inquiry, lead us to say: As there are certain nerves leading from the teeth to the ear, it is frequently the case, that in certain forms of deafness one's hearing may be improved by holding between the teeth a broad plate of some kind that will receive on a wide surface the vibrations of sound from the air. Some time since we received, from a firm in Cincinnati, an instrument arranged for this purpose. It was submitted to a scientific physician, who made several tests with it, and reported in its favor. Upon this report, and the further testimony of some good men whom we know, that it had proved useful, we admitted to our columns an advertisement of it, which had been kept out until investigated. Several inquiries seemed to establish the fact that the company advertising them were no myths, but a sound company, who would fulfil their engagements with the public.—Thus much for the present. Two of our subscribers who bought the instrument report that it is wholly useless to them. An expert in this city tells us that it proves useful in some cases certainly, but that in many others it does not—that it is useful only in certain cases of deafness, and no one can himself tell in advance whether it will be valuable or not. In this condition of affairs, we cannot advise any one to purchase one except upon the express condition that it is to be tried, and, if found useful, paid for, and if not, to be returned. That is the only condition on which we would take one. We also think the company should either redeem the instruments sold when proving entirely useless, or replace them with some form that will be serviceable.

**"Osier, or Basket Willow."**—Every now and then we have inquiry as to the cultivation of the "Osier, or Basket Willow," and the probable profits of the crop, a writer sometimes adding that he has a muck swamp especially suited to its growth. It is a very common impression that there is but one Basket Willow, and that is the Osier. The fact is that the common Osier is the poorest of all the Willows, and is only useful for making coarse, heavy work, such as hampers, market baskets, etc. In England and other countries the choice willows are known by local names, such as Whipcord, Rose Willow, French Willow, etc., and it is these varieties that are used for fine work, such as ladies' baskets, etc. It is a mistake to suppose that willows require a wet, swampy locality. The best basket willows are grown upon good grain land. Another error is, that the basket willows are of dwarf kinds—some of them are large trees, but when cultivated for basket work they are annually cut back to the ground, as only straight rods of one season's growth are of use. As we have before stated, the willow business in this country is in the hands of foreigners, who will not buy American-grown stock at any price. There is no difficulty in growing as good willows in this country as are produced anywhere, but there is no regular market for them. The produce commission merchants manage to get rid of a few willows grown in this country, but they are slow of sale.

**Notes on Blue Grass.**—In an article in September last, Prof. Gray expressed a doubt that the Blue Grass (*Poa pratensis*) was really indigenous so far South as Kentucky. This has called out several notes from friends in Kentucky and Ohio, who claim that the grass must be a native there. "S. C., Jr., Louisville, Kentucky, thinks the readiness with which the grass takes possession of the soil, 'rooting out all other kinds of grass,' is proof that it is native. This is, to us, the strongest evidence that it is a foreigner. As the aboriginal man receded before the intruding white man, in a similar manner do plants give way to foreigners. The Wild Oat that covers the hills of California to such an extent, is a European species that has crowded out all native growth, and the same may be said of the Bermuda Grass in some of the Southern States. Mr. C. states that the reason for calling this beautifully green grass Blue Grass, is on account of its peculiar blue color when in bloom, at which time he says the appearance of the grass is most charming.

(Basket Items continued on page 525.)

## Keeping One Horse—Prizes Offered.

There are vastly more persons who own and keep a single horse than there are those who have a larger number. When there is but one horse, it is most frequently kept and cared for by the owner. The horse may be merely for the use of the family; it may be for the cultivation of a garden or small farm; it may be the means by which a physician visits his patients, or that by which the grocer or other tradesman serves his customers—in all these and a great number of other cases, the animal is more likely than not to be in the care of one who has had no previous experience with a horse—indeed, knows nothing about the matter, beyond the fact that the animal must eat, but when it "gets off its feed," or any of the troubles to which horse-flesh is subject come to his animal is utterly at loss as to what should be done.

In view of the fact that plain and practical directions for the proper treatment of the horse would be useful, the publishers of the *American Agriculturist* offer

### Prizes for Essays on Keeping One Horse.

The Essay need not treat upon the kinds of horses, or the buying of a horse, but assuming that the animal is already in possession, it should cover the whole matter of *keeping*. This includes proper stabling; food, its kinds, how to buy, store and feed; grooming, and whatever relates to the care of the exterior of the horse, including shoeing. The Essay should also recognize and show how to avoid, as well as how to treat, the commoner ailments of the horse, such as coughs, worms, colic, etc. Also, the more frequent external troubles, such as grease or soratches, galls of saddle or collar; the hoof difficulties from bad shoeing—in fact, whatever may be properly treated by the owner, without calling in a veterinary surgeon.

The scope and object of the Essay may be indicated thus: Given a young and healthy horse in the hands of a fairly intelligent owner, how is that owner to so keep and treat the horse, in order that it may continue to give him the longest term of useful service at the least expense. The Essays are to be legibly written on one side of the paper only, in black or dark ink (not in red or very pale blue ink, or in pencil), and should not exceed 6,000 words, which is equal to about two pages of the *American Agriculturist* in this type). Sketches for engravings may be sent, if it is desirable to illustrate the stable, or any other points in the Essay.

### Cash Prizes.

For the Best Essay ..... \$50 00  
For the Second Best Essay ..... 25 00  
For the Third Best Essay ..... 15 00

The Essays to be sent to the *Editors of the American Agriculturist* on or before February 1, 1881, in a sealed envelope (not a roll), with a motto or assumed name, and an accompanying envelope addressed with the motto or assumed name, and containing the real name and address of the writer. The prizes will be awarded by a committee of competent and impartial judges. All Essays submitted for these prizes to become the property of the *American Agriculturist*.

## The Norwegian "Ski," or Snow-Shoe.

One of our subscribers, "M. O. E.," a Norwegian by birth, now living at Norwegian Grove, Minn., sends sketches and a description of the snow-shoes in use in Norway, which are quite unlike those

Fig. 1.—SIDE VIEW OF THE NORWEGIAN SNOW-SHOE.

made by our northern Indians, and copied by the Canadians and others. They are made of straight-grained Ash, or Oak, about  $\frac{1}{4}$  of an inch thick under the foot, and taper to  $\frac{1}{8}$  of an inch behind, and  $\frac{1}{4}$  of an inch at front. The shoe is given in side view in figure 1, and figure 2 shows the shoe as

Fig. 2.—THE SNOW-SHOE AS SEEN FROM ABOVE.

looked at from above. The length is 9 feet, and the width is  $2\frac{1}{2}$  inches at the heel, and enlarged to  $3\frac{1}{2}$  inches at the point, where the toe turns up. A small block, *a*, in both engravings, an inch wide and half an inch high, is fastened to the shoe by two screws. This is for the heel to rest against, and to keep the foot from slipping back. At *b* is a strap of strong leather, to hold the foot, and should be of a proper length and distance from the block

to fit the foot. It is fastened to the edge of the shoe at each side with screws; it is better to have a piece of tin, with holes punched for the screws, to go over the ends of the strap, as this will prevent the leather from tearing away from the screws. To make the bend at the toe shown in figure 1, scores are cut with a sharp-pointed knife, as shown at *c*, figure 2. In order to make the shoe run straight, a groove is made the whole length of the shoe upon the under side, as shown in section at figure 3.

Fig. 3.

When the shoe is ready to bend, it is smeared with grease on both sides of the part to be bent, and held to the fire, and made very hot; they are then brought to the proper shape by bending upon a log of the proper size, and bound or otherwise fastened in that position for 24 hours. Our correspondent says that in old times these shoes were worn in his country even by the soldiers, who had the right one made about two feet shorter than the left, to allow of making short, quick turns. He says that while beginners may meet with falls, a little practice will make it easy to use them, and that they will be found greatly superior to the Indian snow-shoes, and thinks that the boys will find great fun in sliding down hill, and over snow-drifts, in a manner that would not be possible with the others. The Norwegian name for these is "Ski," and we agree with him that to distinguish them from other snow-shoes, the same name would be best here.

## Clean Grass Land.

The great majority of meadows, in the older States, are more or less foul with "plants out of place," yarrow, white-weed, thistles, John's-wort, dock, and other unclean herbage. Next after clean tillage, the remedy for these unclean fields is pure grass seed. Designed adulterations in grass seed are probably rare, yet most of the seed sold in our large markets is not entirely clean. Some of it is very foul, and inflicts great damage upon the farmers who purchase it. It adds to the cost of every crop cultivated upon the ground where it is sown for many years afterward. We are glad to notice, in our visits among farmers this present season, that they are taking the remedy for this nuisance into their own hands, and are growing their own seed. However ready a man may be to send foul seed to market, he is not likely to cheat himself, in growing it for his own use. It is not a very difficult thing to clean the half-acre patch, or less, reserved for seed, of all foreign plants, so that the farmer may know that he has pure timothy, red top, or clover seed for his own use. He also has the satisfaction of knowing that the seed is of the previous year's growth, and is very sure to spring up under favorable conditions. The complaint of foul seed is very general, and the proofs of its use, in past years, are abundant on the great majority of farms. It is a rare exception to find a farmer who is thoroughly conscientious in keeping a clean farm, and

in raising clean seed for market. Wholesale dealers have the means of detecting foul seed, and of keeping them out of the market, but there is a lack of conscience in trade, as well as upon the farm, and much hay seed, mixed with the seeds of weeds, is sold every year. In the present state of the market it is altogether safest, and cheapest, for the farmer to raise his own grass seed. He is sure then to begin right in stocking his grass land. If he will take a little time, every season, to pull every scattering weed that he may find in his meadows, before, and after mowing, he will be sure to have absolutely clean grass land, which is as profitable as it is beautiful.

### To Wash Flannels without Shrinking.

—First have soft water for the whole process, made so artificially if necessary, and next have good soap, or that which does not contain rosin. Our best soaps are safe for this purpose. You may wash and rinse entirely in cold water if you

choose, but if you wash in warm water you must not rinse in cold. It is decidedly best to use only warm water all through, the rinsing water warmer than the suds, if there is any difference. It is best to make a good, strong, *clean* suds (that is, don't wash the nice white flannels in a dirty suds with other clothes that are to be hoiled), and put the flannels in it, instead of rubbing soap into the cloth. Hand rubbing tends to full and shrink flannel, as it mats and interlaces the delicate fibres.

## A Simple Portable Fence.

There are many places on the farm, and especially about the barns, where a few lengths of portable

Fig. 1.—FORM OF SINGLE HURDLE.

fence are a great convenience. It may be that an inclosure is needed for some sheep, or a pen is required for a calf, etc. In such cases a hurdle fence of some kind, one that may be cheaply and easily made, and that, when not in use, can be packed away in small compass, is an important part of the outfit of a farm.

Fig. 2.—THE POSTS.

The accompanying engravings show a simple fence of this kind. Figure 1 gives the form of a single hurdle, or length, made of four strips of inch board, twelve feet long, and of a width depending upon the purpose for which it is to be employed; a fence for small stock will need wider boards than for turning large animals. The perpendicular pieces are three in number, the outer ones set far enough back from the ends to allow the supporting posts, fig. 2, to take the position shown in figure 3. The next to the upper strip rests in the crotch of

Fig. 3.—THE FENCE COMPLETE.

the posts, while the bottom strip fits into a notch in the cross-piece, near the feet of the posts, thus making the fence firm and secure. The hurdles and supports, with the manner of setting up the fence, can be understood from the engravings.

## "Eurotas" Wonderful Butter Record.

We have no authoritative system of testing the butter or milk yield of cows. If a horse is vaunted as trotting in less than "2:20" the claim is disregarded unless it has been done "in public." He has no record unless a public one. We may believe the statement or not, according to our knowledge of "the man who held a watch on him." With cows it is different. They have, and at present can have, no public record. The two butter cows which are above all others famous in this country really live public lives—everybody interested knows or may know almost everything about them. As trials go along they are reported in the papers, the butter is shown and seen, and the cows have numerous visitors. Prying and inquisitive

some are, no doubt, and if a suspicion of unfairness had been breathed, every one would have known it.

"Eurotas" has just closed her year, and presented her owner a beautiful solid-colored heifer calf, by the "Duke of Seituat," son of "Jersey Belle of Seituat," thus crossing those two famous strains of blood as near to the fountains as possible.

"Eurotas" calved October 31, 1879, and again November 4, 1880. All the milk was weighed, set, skimmed, the cream churned, and the butter weighed from the 10th day of November to the 15th day of October, being 341 days. From the figures furnished we have calculated approximately the daily yield both of milk and butter, which shows some curious variations as the time goes on from calving to grass (at which time there is a notable increase both of milk and butter), and from grass to calving again.

Month.	Total Milk. Lbs.	Per diem average. Lbs.	Total butter. Lbs. oz.	Per diem average. Lbs. oz.
Nov'ber (21d.)	451	20 1/2	40 1	1 14 1/2
December	755	24 1/2	74 0	2 2
January	746	24 1/2	79 2	2 8 5/8
February	663 1/2	23	77 1	2 10 1/2
March	653 1/2	21 1/2	75 6	2 7
April	602	20 1/2	68 11	2 4
May	770 1/2	24 7/8	87 11	2 13
June	637	27 9/10	88 6	2 15
July	760 1/2	24 1/2	80 5	2 9
August	704	22	66 7	2 2
September	434 1/2	15	32 5	1 1
October (15d.)	123 1/2	8 1/6	8 10	9 1/6
Total	7,525	22 1/2	778 1	2 4

The yield of milk is, of course, not extraordinary, but that of butter is unsurpassed. The nearest approach to it is that of "Jersey Belle of Seituat," whose yield was 705 pounds. There was a time in June when "Eurotas" was giving three pounds of butter a day, or a little over, but this was not continued through one calendar month. She yielded an average of two pounds and four ounces (2 lbs., 4.03) a day for the time she was milking, and two pounds two ounces (2 lbs., 2.03) for the year.

The record clearly indicates that either the cow was not well throughout the year, or she was not fed so that she could do her best. In our opinion, with a well arranged ration of hay, roots, bran, and meal, no such great difference between the yield on hay and mixed food and on grass ought to be observable, as seen in this case.

### Great Exports of Grain Continue.

After three years of good crops here, and the poor ones in Western Europe, which opened a market for our supplies, we could hardly expect a continuance of the good fortune, and grave fears were generally entertained that the large supplies of 1880 would result in a great overstock which would sink prices to a very low figure. But now Eastern Europe is deficient, and the competing supplies of wheat usually sent from the Black Sea region will not appear. So all we have to spare will find a market abroad at remunerative rates. A study of the condensed tables in our market reports will always be found interesting. Thus we see by table 4, on page 526, that from January 1 to November 8, the exports of Wheat and Corn from New York City alone have reached the following enormous figures, reckoning a barrel of flour as equivalent to five bushels of wheat:

	1880.	1879.	1878.	Total.
WHEAT, bush.	72,781,000	70,878,181	58,182,823	201,842,004
CORN, bush	45,141,000	29,248,000	24,019,000	98,408,000
Total bushels	117,922,000	100,126,181	82,201,823	300,250,004

Or the total bushels of these two articles of bread-stuffs exported from New York alone for a little over ten months of three years exceeding three hundred million bushels (300,250,004). During the same periods, some seventeen million bushels of Rye, Barley, Oats and Peas were exported. And these exports are still continuing and will continue on a liberal scale well into next summer. As will be noted in the market report, we have on hand already in our markets "visible supplies" of nearly forty million bushels of wheat and corn, besides the large stocks still on the farms.—One can hardly comprehend the magnitude of the figures without taking some such illustration as this, to wit: That a single million bushels will load 4,000 freight cars with 250 bushels each, or 25,000 wagons with 40

bushels each.—Note that above we have only spoken of one shipping port, for part of the years, and have not taken into account San Francisco, Philadelphia, Baltimore, Boston, and numerous other exporting points of considerable importance.

### Corn Shellers—The "A. B. C."

There is probably no farm implement of which inventors have presented so many forms as the Corn Sheller. It must rank very near the washing-machine in the records of the Patent Office. As in many other cases, when a really effective machine is produced, it is found to be exceedingly simple. The "A. B. C." Sheller may be instantly adjusted to shell the smallest pop-corn, or the largest horse-tooth varieties; it removes every kernel, delivers the corn at one place, and throws out the cobs at another. A small fan blows the chaff from the corn; it runs with ease and works rapidly. An examination of the interior shows it to be of the simplest structure; nothing to get out of order. Even the most careless "help" would find it difficult to disable the machine. The engraving represents this Sheller, which it will be seen is very compact, taking up but little room, either in transportation, or when set in its place. Mr. Cohn, who makes the implement, informs us that it has met

THE "A. B. C." CORN SHELLER.

with a very general acceptance in Central and South America, and that the demand from those corn-growing countries is very large.

### Coöperative Stores.

We are in the receipt of numerous letters asking about coöperation, and have been at a loss what to reply or what to recommend. Now, however, thanks to the visit of Mr. Thomas Hughes to this country, and to the exertions of certain respectable citizens of New York City and County a "Central Coöperative Board" has recently been organized to promote the formation of local Coöperative Societies all over the country. A large number of the best and most public-spirited citizens of New York offered, through this society, a public reception to the English philanthropist and statesman, which was very numerously attended. Mr. Hughes addressed the meeting on the subject of coöperation, and in this admirable address and the speeches which followed, the subject was earnestly pressed upon the American people. The plan is briefly as follows: Consumers of groceries and manufactured articles in any place unite in forming a society; they determine the price of one share of stock and the number of shares, and organize under the laws of the State for forming joint-stock companies. The shares may be paid for in whole or in part. The money is taken to buy the goods needed at wholesale. These are sold for cash at usual retail prices, no effort being made to undersell other stores. The storekeeper and clerks, if he or she has them, are paid salaries, and the pro-

fits are divided quarterly among the stockholders in proportion to their purchases.

It is a prime principle with the "Coöperators" to have nothing to do with adulterated or misrepresented goods of any kind, and to sell consumers such articles as they need of the best quality.

There is already considerable important literature on this subject, chiefly in the form of speeches and addresses; enough of this will be sent by the Central Board to any applicants, to give a good idea of the scope of the enterprise, and of how to best go to work to start a coöperative store in any neighborhood. Those desiring further information would do well to address "The Central Coöperative Board, No. 291 Broadway, New York." We may add that in many cases coöperative stores in England have paid very handsome dividends to stockholders, and that the number of such stores in that country is largely increased year by year.

### Forty Years!

As the *American Agriculturist* for 1842 constituted Volume 1, the numbers for 1881 will complete the "Two Score" or round 40 Volumes!

It would be interesting to go over the history of these years had we space. Forty years ago there were few railways, no ocean steamships, and no telegraph. To send the briefest message eighty miles by mail cost 18¢ cents postage for each small piece of paper. Harvesters, mowing machines, cultivators, horse-rakes, and a hundred other improved implements were unknown. We well remember our great satisfaction, not long before that period, at getting a cast-iron mould-board plow in place of the wooden one previously used; also at buying cut nails at 16 cents a pound, instead of using wrought nails hammered out on the blacksmith's anvil. We also recall the excitement on our then far western farm, upon the appearance of our first "Elliptic" or steel-spring wagon. Also the advent of the fanning mill, and of the first cooking stove, with its bake oven, etc. An earlier number of this journal described the first steel plow. Sewing machines were scarcely thought of; every stitch was done, one by one, with weary fingers and aching eyes.—The above are but specimens of a thousand improvements since No. 1 of this paper went out on its mission.—What changes in our own land and government! What was then the western edge of our cultivated country is now east of its center. The map of Europe differs widely from our school geography. The powerful Germany of to-day was not in existence, save as a great number of petty States, with hardly a bond of union in government or interest, except the similarity of language. Almost the same of Italy.

Of the first thousand Readers of the *American Agriculturist*, less than a hundred to-day remain alive. Of the half million Subscribers whose names have been on our mail books during these forty years past, between three and four hundred thousand sleep beneath the soil they cultivated. But most of them no doubt did their allotted work well, and they have gone to their reward.

We are spared, and as we begin the work upon our 40th Volume, it is pleasant to know that some of the first readers still remain as patriarchs in the *Agriculturist* family, along with tens of thousands of the second and third generations—the sons and grandsons, and the daughters of earlier readers.\* With these are numbered many other thousands of newer readers, who are heartily welcomed. We trust they will find in our columns much that will interest, and much that will profit them.

We shall now begin our work upon Volume 40 with cheerfulness, with earnestness, with added experience, and with a determination to make it eminently worthy of its distinguished place in the series. We invite every present reader to continue with us, and to bring along troops of new friends. Our best efforts will be put forth to do them all the good possible.

\* We shall be much pleased to receive a brief note or letter from each present subscriber, who has been a continuous or nearly continuous reader from the first No.

### Trusses in Barn-building.

Our barn-cellars, and often enough the principal floors of barns, are obstructed by piers or posts, which seriously interfere with the room, and yet more with their convenient use. A correspondent sends us sketches of his simple trusses. They are

Fig. 1.—IRON BOLT FASTENING.

of two forms: one in which the brace-beams are fastened to the tie-beam by a long iron bolt, fig. 1; the other in which the brace-beams are notched into an upright post, shown in figure 2, the post being bolted to the tie-beam by a bolt, holding by a nut let into the post like an bed-screw. This is shown in figure 3, which is a view of the truss from below, looking upward, showing the iron-plate crossing the tie-beam of the truss, and supporting the string-pieces on which the floorjoists rest.

The sills and cross-beams of a barn, fifty feet wide, need but a single supporting post or pier

Fig. 2.—WITH AN UPRIGHT WOODEN POST.

each in the center. The trusses, 25 feet long, being made of 4 by 8 timber set edgewise. Inch-and-a-quarter iron bolts are needed, with half-inch washers, both for the heads of the bolts and for the nuts. When the upper ends of the braces are mortised into a post (fig. 2), three-eighths or half-inch plate-iron should be used as shown in figure 3, instead of washers under the head of the bolt. There is room

Fig. 3.—BOTTOM OF TRUSS.

for such trusses on the outside, under the windows, and within the barn in the partitions—each side of the barn floor, and wherever partitions occur, as between bays. It is not difficult, with a little contrivance, to strengthen a cross-beam so as to take a post out almost anywhere where space is needed—in the cellar or elsewhere. Such a change, when made, will often be found so great a convenience in turning carts and wagons in a cellar, that the wonder will be that it had not been made long before.

### "How Pure Milk May be Supplied to Boston."

This is the title of a pamphlet embodying a plan submitted by the Worcester West Milk Producers' Association to the producers and consumers of milk for the city of Boston. At the outset a very plain truth is stated in a very plain way: "To sell milk as milk is probably more difficult than to sell anything else raised on the farm." The present bad state of the milk trade is presented under the heading *Adulteration*: "It is safe to say that the majority of well-to-do people in the city, not to speak of poor people, are supplied with milk which is a libel on the cow which is supposed to have produced it." For this there is claimed to be a remedy. An organization is proposed similar to the notable Aylesbury Dairy Company that has been so successful in London, England. The capital stock is divided into small shares, a portion of which is to be held by the consumers, the balance of the stock, and the larger part, to be in the hands of the farmers, the object being to get the largest number of producers and consumers interested who will work for the welfare of the company.

The chairman of the State and City Boards of Health is to be, by virtue of his office, one of the directors of the company. A chemist is to be employed to inspect the milk. "We believe the majority of farmers are honest and never send to market any milk that has been watered. But human nature is weak, and farmers being human, it would do no harm to have them bolstered up by a chemist to keep them from going astray." A similar organization has been in operation for eight years in the city of Syracuse, N. Y., with a success equal, though on a smaller scale, to the one in London. Under such a system each producer sells his own milk, because it is through a company of which he is a stockholder, with stock just in proportion to the amount of milk he has to sell. This is a matter which concerns other cities than Boston. The inhabitants of every town and city are interested in the milk supply, and the sooner some practical method can be devised for the distribution of absolutely pure milk the better it will be for both the consumers and the farmers who produce it.

### Tenant Houses on Farms.

We are near the end, we trust, of a transition state, from dear and irregular labor to that which is cheap and steady upon our Northern farms. In the older States, since the war, the policy has been to get along with as little labor as possible, and to hire only in the summer by the month or day during seed-time and harvest. On hundreds of farms very little labor is employed beside that of the owner and his boys. The result is seen in the two facts that the population is waning in these districts, and many of the farms are for sale at first cost of the buildings upon them. In the olden time, in New England, we had cheap and abundant labor, and of the best kind. Farmers' sons, trained from their boyhood to farm work, hired out for years to accumulate capital enough to stock a farm and start business for themselves. They lived in the families of their employers, and were skillful and reliable help. This class of labor is almost unknown now. The cities, the factories, the colleges, the schools, the new States and Territories take nearly all our farmers' boys and girls, and we have to depend on foreigners for help. This is likely to be our main dependence in the future, and we must make the best of it. There is a reluctance to take them into the family as boarders, not so much on the score of prejudice, as of increased labor in the household. So the farm hand is hired only by the month or by the day, and much of his time is idle for want of employment. The farm suffers for want of labor, and he suffers for the lack of employment. What is wanted now is a cheap, comfortable farm cottage, where the laborer can have a steady home, and the farmer can have steady, reliable labor. The advantages of this course are manifold to both parties and to the community. The farmer, in the cottage, makes a handsome addition to his capital. It costs, say, six hundred dollars in money, material, and labor, most of which is furnished from the farm. This is to pay eight per cent interest on cost, to be paid in labor every month, say, four dollars a month. The farmer needs the work, and it is as good to him as the money. The investment is in his own hands, and more sure than savings bank or railroad stock, as long as he runs a farm. He secures, also, steady, reliable help every day in the year, and can lay his plans to grow his crops, and make his improvements intelligently. He knows just what his labor is going to cost him, and what improvements can be made. This labor, under his own training, is all the while increasing in skill and effectiveness, and he can use machinery in growing and harvesting crops to the best advantage. He also secures a good home market for a part of his farm products. His tenant has a wife and family, and the supplies of fuel and food would naturally come from the farm. Many other supplies of dry goods and groceries, would come from the store where the farmer traded, and could be paid for in barter, so that rent and farm products would pay for from one-half to three-fourths of the labor bill. This arrangement would solve the

question of hoard. Extra hands, if needed, could board at the cottage. The laborer would gain quite as much as the farmer. He would have, to begin with, an employer interested in his welfare, and in the improvement of his skill and his moral condition. He would have a fixed home, and the means of supporting his family in comfort. He would have remunerative employment for every day in the year that he was able to work. No time would be lost in waiting for a job, no apprehension of the failure of fuel and bread. He would have good schools and church privileges for his children; and they would have as bright prospects in life as any of their neighbors. Society would gain very much by this arrangement. There would be two families instead of one on the farm, and if this custom should become general, there would be a large addition to these districts that are now waning in population and wealth. The school houses and churches would be well filled again. The farms would have plenty of labor, increase in productiveness, and rise in value. In short, prosperity would be restored to these waning agricultural districts. Let us have Tenant Houses on our large farms, and secure for ourselves the many privileges that they will bring. CONNECTICUT.

### The Dung Heap.

The manure pile has been called, and not without good reason, the "Fountainhead of Benediction." Good farming in an old country (and we are not sure but in a new one also), begins with a strict

Fig. 1.—STABLE WITH MANURE CELLAR.

economy at the manure heap, and the liquid fertilizing elements that come from the farm animals. There are two distinct methods of saving this manure, namely, the dry and the wet way. In the former, absorbents, as dry earth, leaves, etc., are employed; in the latter, all the liquid is received in tanks, and applied to the land in that form. If the dry or absorbent method is adopted, it is best to locate the stable on a side hill, that a manure cellar may be secured at little cost of excavation. Figure 1 shows a diagram of a stable with a manure cellar, C, under the stable, provided with a door, K, for the removal of the manure. The floor of the stable should be of plank, with a gutter behind, and a trap door for passing the manure to the cellar.

Fig. 2.—STABLE FOR LEVEL GROUND.

below. A diagram of a stable for level ground is shown in figure 2. The cow stands upon the slanting floor, A, with a depression, C, behind for the accumulation of the manure. This portion, as well as the floor under the cow, should be finished in cement. A passage for distributing food is at B, with a root cellar, D, below. There is a loft, E, above, for the storage of hay. Such a stable is especially designed for the keeping of one cow.

## Irrigation in Shadtown.

BY TIMOTHY BUNKER, ESQ.

MR. EDITOR.—Since my experiment in "the irrigation of the land," twenty years ago, on the Horse Pond lot, the physie has been working slowly, but quite surely, in all the neighborhood. It took Jake Frink a great while to understand the philosophy of draining at the bottom, and pouring water on top, and he does not fairly understand it now. He was wont to put the case in this style:

"Ye see, Squire Bunker, it is no kind o' use to pour so much water on to the top of the land, that's what's the matter with half the pastering I've got. It has too much water already. Jest look at the back part of my cow paster. It's covered with water all the spring, and skunk cabbage, poke root, and brakes grow like weeds all through the summer, but grass is mighty skase. Ef ye sow grass seed on't, it don't seem to do any kind of good. It gets killed in the winter, or choked out by the weeds. A feller has to be mighty smart with the hush scythe to keep down the hardhack, the alders, the wild roses, maples, and elms that keep springing up. 'Taint much use to be fightin' eternally with the nateral hent of the sile. Some sile was made to grow hardhack and skunk cabbage, and it's agin nater for it to produce clover and red top. I can see that there's some sense in draining off water from such land, but when you come to pouring on more water on top, it seems to be making a bad matter worse."

But Jake did not apply his sense to his cow pasture, did not dig any ditches to draw off the surface water, and it has run largely to brush. But there was the living argument of the Horse Pond lot, with drains at the bottom and irrigation at the top, which contradicted his philosophy and kept him in a stew. His neighbors who attend the Farmer's Club, and take the *American Agriculturist*, had more faith and believed facts, if they could not explain them. Three tons to the acre was worth looking at and striving after, whether they could understand it or not. They began to look about for small streams upon their farms, that could be turned out of their course upon the neighboring upland. Small ventures were successful. Grass sprung up in the track of the water, earlier in the spring, was more abundant in the summer, and lingered longer in the fall, and was sometimes green at Christmas. There was no mistaking the fact. Irrigation often came up in the Club. The irrigation ditches multiplied. Idle streams were utilized. Stunted, gravelly pastures grew green, and the sod thickened, meadows yielded more hay. Stacks multiplied, the barns had to be enlarged, and many farms increased their stock. Irrigation was a success, and Tim Bunker had carried his pint, according to the prophecy of Seth Twiggs.

This summer I was over in Shadtown, to visit the farm of Solomon Wise. It consists of 225 acres of land, of average quality with the farms in the neighborhood. It has been the homestead of the family for three generations at least. Here Solomon's father lived, an enterprising farmer in his time, and did a large business in raising mules, and in trading them off for the West India market. Some fifty years ago, or more, he bought a celebrated Jack, and greatly increased the size of his mules, for which there was then a lively demand. The beginning of the system of irrigation that prevails upon this farm dates back to the time of his grandfather, a hundred years ago or more. Any good farmer, in riding by, would notice the exceptional greenness and fertility of this farm. This is owing mainly to the free use of water for a hundred years or more upon about 40 acres of the farm. The system of irrigation is of the simplest and most inexpensive kind, just such as any skillful farmer could make for himself, without the aid of stone mason or engineer. Near the north end of the farm a small trout-brook comes in, never big enough for a mill stream, and, in summer, dwindling away to a mere rill. It is fed by springs, and in these springs the trout survive through the heats of summer. This brook is dammed near the spot where it enters the farm, with a slight bank of earth and stone. No effort has been made to accumulate

water in a reservoir, though it could be done at a small expense. The brook rises in a swamp a mile or two above, and the basin embraces several thousand acres, which would collect a large supply of water, if it was husbanded. Only a part of the natural flow of the water has been turned out of its channel. The irrigating ditches, of which there are several taken from the main stream, are small and narrow, and have a very slight fall. They could be made very rapidly with a plow and ox-shovel. The forty acres put under water slopes gently to the south and east. The water is taken out of these irrigating ditches in slight rills, and passed over the meadow as evenly as possible. Any surplus water falls into the ditch below, or is returned to the brook. The distance for which the water is diverted from its natural channel is less than a quarter of a mile. The water is kept flowing summer and winter, and the winter flowage carries quite as much fertilizing matter as that of summer, and perhaps more. The refuse vegetable matter, gathered in the swamp above, floating leaves, wash of roads and brook channel, is carried down to these meadows. The water is often discolored in heavy rains, and even that which seems to be pure, carries more or less sediment with it. The liquid manure may be very thin, but the fact is well established that, wherever water runs over a well-drained soil, grass springs up in greater luxuriance. The purest spring water makes grass wherever it flows. While Solomon Wise sleeps, in summer and winter, this brook is making money for him, as it did for his father. The only expense to him is the slight labor of keeping the ditches clear, and of regulating the flow of the water. The soil is a gravelly loam, and slopes so much that there is little chance of stagnant water. In the opinion of Mr. Wise, the crop of grass is doubled by the irrigation alone.

There are several advantages of this system of irrigation besides the large increase of the grass crop. All these forty acres of meadow can be kept perpetually in grass, which is probably the most profitable crop upon the farms of New England. There need be no more plowing, no more tillage crops upon these acres. The sod may thicken from generation to generation, and produce that best of all forage, a thick, fine hay, made from a mixture of grasses grown upon an old sod. Then top-dressing, when it is applied, can be turned to the best advantage. The manure is carried down immediately to the roots of grasses by the large supply of water upon the surface. There is no loss from evaporation. The soil is kept up to a production of nearly two tons of hay to the acre, without any top-dressing. Upon this the calculation is based of the value of irrigation upon this farm. We suppose the natural production of the land to be not over a ton to the acre. A ton to the acre would be a fair estimate of the hay made by the irrigation. Hay sells in the neighboring city markets at from fifteen to twenty dollars a ton, depending somewhat on the season, and the quality. If we call the hay ten dollars a ton standing, it would give \$400 as the annual dividend declared by the brook. The investment is about as secure as Government bonds, which pay 4 per cent nearly. The income is about the same as \$10,000 in United States Stocks. Not every farm has the facilities of this for irrigation, but many have small streams running to waste that might be utilized at small expense, and made to pay good dividends. Let us look after them.

Hookertown, Ct.,  
Nov. 1, 1880.

Yours to command,  
TIMOTHY BUNKER, Esq.

### Accumulation of Manure in Stables.—

A large mass of dung, unless frozen or kept near the freezing point, will undergo decomposition, and gives off, besides steam, ammonia, and other gases. These tend to soften and injure the hoofs of animals, and especially horses, that may be forced to stand continuously upon the accumulation of dung. These gases cause inflammation of the eyes, and injure the general health, interfere with the digestion, and reduce the vigor of the animal. There should be no mass of manure in any stable where horses are kept. A clean floor and pure air are requisites for the best health of the animals.

## The Rib-Grass, or English Plantain.

Among the plants recently sent in for naming and information upon its fodder value is the Rib-grass (*Plantago lanceolata*). The letter accompanying the plants stated, the "new comer must have been introduced in the clover seed, as it first appeared upon the farm in the clover field." This is probably true, as this weed is most commonly carried into the newer settled portions of our country in clover seed. The seed of the Rib-grass and Clover are so nearly alike in size and color that their separation is effected with difficulty, and the presence of the weed seed is not noticed without more than ordinary inspection. By the aid of a hand-lens or pocket magnifier, the differences are shown at once.

RIB-GRASS, OR ENGLISH PLANTAIN.

The Clover seed is in shape much like a small bean, and alike on both sides, while the Rib-grass seed is convex on one side, and concave on the other. The differences are shown in the seeds in the upper part of the engraving, those on the right being those of the common Red Clover, with one seed considerably enlarged, and on the left those of the Rib-grass. The Rib-grass belongs to the same genus as the Common Plantain, so frequently found about our door-yards, but differs from it in growing to a greater height, the leaves being long and slender, and the long flower stalk bearing a comparatively short spike or head of inconspicuous flowers.

The engraving is a much reduced one of a Rib-grass plant with its strong perennial root, and will be quickly recognized by many farmers, especially in the older parts of our country. This Rib-grass cannot be classed among the worst of weeds; in fact, it has been frequently sown for pasturage; it is eaten by nearly all kinds of farm stock, especially sheep. It is so inferior in quality and productiveness to many other forage plants, that its chief harm is in occupying the soil to the exclusion of better plants. Great care should be taken to sow only pure seed—inspect all clover and other seed coming from older parts of the country. The plants may be choked out by a heavy growth of clover and other valuable crops.

**A Country House, Costing \$2,200.**

BY S. B. REED, ARCHITECT.

These plans are prepared for a convenient and comfortable dwelling, especially adapted to the requirements of farmers.... **Exterior** (fig. 1).—

Fig. 1.—FRONT ELEVATION OF THE HOUSE.

The front has a breadth of 38½ feet. The foundations show two feet above the ground. An additional elevation of the whole building can be given by raising the ground a foot or more immediately surrounding the building. The outlines and projections are sufficiently diversified and angular to comport with rural surroundings. The details of the exterior finish are simple in design, and in all cases arranged to serve some practical purpose.

.... **Cellar.**—For want of space the cellar plans are omitted. Provision is made in the estimate, however, for a cellar extending under the entire building, with stone walls six and a half feet high, and having five small windows, an outside entrance, and stairs leading to the work-room above.... **First Story** (fig. 2).—Height of ceiling in main house, ten feet; in wing, eight feet eight inches. A hall, parlor, living-room, bedroom, work-room, pantry and three closets, are embraced in the divisions of this story. The front entrance is from a pleasant piazza to the main hall, and from it each of the principal apartments of the first story are entered. This hall also contains the main flight of

Fig. 2.—PLAN OF FIRST STORY.

stairs leading to the second story. The space under the stairs is left open far enough to allow for a

passage to the bedroom. The Parlor is of fair size, well lighted, and contains a marble mantel. The Living-room is the most spacious apartment in the house, intended as the common gathering place of the family. Its interior arrangement is partially shown in figure 4, where views of one side and both

of its ends are given. The side not shown has doors opening from the rear piazza and pantry, with a window between giving views to the rear. A large range, with elevated oven, is set in the fireplace, with a shelf above. The space between the chimney and end wall at the right, is filled out flush with the face of the chimney breast, and furnished with a fuel box below, and shelving with glass doors above. The fuel-box has capacity for a barrel of coal, and is hung to balance weights, and operates as a dumb-waiter, filled in the cellar and runs up

to where its contents may be easily reached, and passed to the range as required. An opening is made through the hearth beneath the range, through which all the ashes fall into an ash pit, formed in the foundation of the chimney. By these arrangements it will be seen much of the

Fig. 4.—INTERIOR OF THE LIVING-ROOM.

heavy work is saved and the scattering of coal dust and ashes prevented. A ventilating register is placed in the chimney above the range, near the ceiling, to draw off the heated air and steam constantly arising from the range when in use. At the right-hand end of the room are two windows giving views to the side. Between these windows an ironing board is placed, and being hung with hinges, may be let down so as to occupy but little space when not in use. Above the latter a clock and lamp shelf is placed on small brackets of scroll work. The right-hand door opens to the parlor or sitting-room; the one next to it leads to the main hall, and the third in the center of the left-hand end opens to the work-room. The Work-room is designed as a sort of kitchen, where the coarsest work is done. It has two windows, and doors opening from the outside, a stoop, pantry, kitchen, and stairs from the cellar and the second story. This work-room contains a pump, sink, and three stationary wash tubs. The Bedroom is pleasantly situated with outlooks to the front, and is sufficiently removed from the routine and noise of the general housework to insure its being quiet at all times. A person having many official or professional calls, requiring an office, might appropriate this room to that purpose, by simply changing one of the windows to a door or outside entrance. The Pantry is of good dimensions, and conveniently arranged as shown in figure 5. It is entered from the dining-room and work-room, and is lighted by a full-sized window. A wide plank extends around three

of its sides, as a work-shelf, with a wash-tray inserted opposite the window. The space under this shelf is occupied by closets and drawers on two sides, the balance being left open for barrels, etc. Above are shelves, placed at convenient distances from each other, and inclosed on one side with sash doors.... **Second Story** (fig. 3).—Height of ceilings in main part, eight feet, and in the wing, 4 to 8 feet. There are five sleeping apartments, five closets, a bath-room, and two small halls in this story. The platform near the head of the main stairs is on a level with the wing floor.

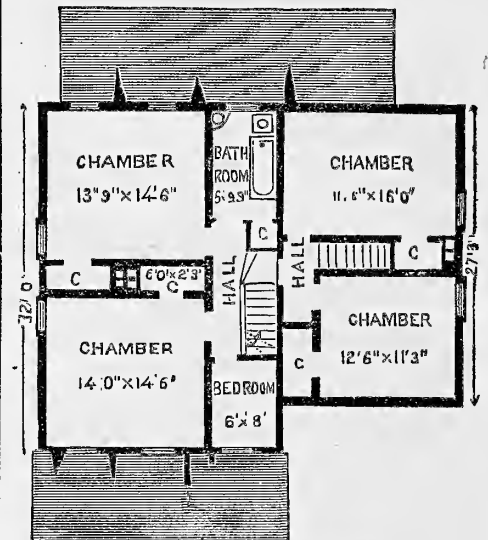

Fig. 3.—PLAN OF SECOND STORY.

The stairs to the attic are placed over the main flight.... The following **Estimate** indicates the character of the work, and the cost of materials:

80 yards Excavation, at 25c. per yard.....	\$20 00
1,350 feet Stone Work (complete) at 8c. per foot.....	108 00
4,000 Brick in chimneys (complete) at \$12 per M.....	48 00
850 yards Plastering (complete) at 25c. per yard.....	212 50
6,500 ft. Timber, at \$15 per M.....	97 50
Sills 4x8 in. 170 ft. long.....	104 00
Girders 4x8 in. 67 ft. long.....	51 20
6 Posts 4x7 in. 21 ft. long.....	84 00
3 Posts 4x6 in. 13 ft. long.....	39 00
Ties 4x6 in. 275 ft. long.....	412 50
Plates 4x6 in. 100 ft. long.....	125 00
Vndr Timbr's 3x8 in. 200 ft. l'g.....	300 00
150 Joists, 3x4x13 at 15c. each.....	22 50
300 Wall Strips, 2x4x13 at 12c. each.....	36 00
186 Siding, at 28c. each.....	52 08
Cornice materials.....	30 00
500 Shingling Lath, at 6c. each.....	30 00
73 bundles Shingles, at \$1.25 each.....	91 25
250 ft. Tin, Valleys, Gutters and lead-rs, at 8c. per ft.....	20 00
319 Flooring (inside), 9½ in. wide, at 28c. each.....	89 32
80 Flooring (outside), 4½ in. wide, at 15c. each.....	12 00
5 Cellar Windows, at \$3 each complete.....	15 00
24 plain Windows, at \$7 each complete.....	168 00
Veranda finish, \$60; Stairs, \$60; Mantels, \$50.....	170 00
23 Doors (complete) at \$8 each.....	184 00
Closet finish, \$70; Plumbing, \$150; Painting, \$150.....	370 00
Carpenters' labor, not included above.....	300 00
Carting, \$30; Incidentals, \$67.60.....	97 60
<b>Total.....</b>	<b>\$2,200 00</b>

**Shade Trees for School-Houses.**—Not one in ten of our country school-houses is shaded by a single tree. Indeed, a school-house may usually be recognized by its bleak appearance, and the entire lack of shrubs and flowers about the grounds. If bought, the trees would cost only a small

Fig. 5.—ARRANGEMENT OF THE PANTRY.

amount, but in most cases there need be no outlay of money, as native trees may be had for the digging. It would be easy for a teacher to have a tree-planting "bee" on a Saturday, when the older boys would gladly volunteer to perform a task which would add greatly to the cheerful appearance of the school-house and its surroundings.

### The Southdown Ram, "Stalwart."

The accompanying portrait is of "Stalwart," an excellent Southdown ram, bred by Henry Webb, Esq., of Streetley Hall, Cambridgeshire, England, and imported by Mr. Samuel J. Sharpless, of Philadelphia, to lead the flock at "Lenape Farm," Mr. Sharpless' country seat, in Chester County, a few miles from Philadelphia. This flock consists of forty breeding ewes and their natural increase. It is, we believe, pre-eminently a Webb flock, the progenitors of it having been bred from rams imported from the late Jonas Webb of Babraham, the father of the breeder of "Stalwart." They are excellent sheep, of great substance, well woolled, and of good constitution. We are glad to learn from Mr. Sharpless that there has been an unusual demand for rams. Our readers know our high opinion of the breed. It exhibits ovine proportions in extraordinary perfection, and where quality of mutton rather than simple weight is an object, no breed is more attractive to the general sheep-raiser. The animals are well-formed, economical feeders and mutton-producers, making excellent early lambs, and yielding fair fleeces of medium wool. The Southdowns have not black, but brownish gray faces and legs, which are bare to the knees and hocks. They are very small-boned, with little offal, broad in the chest parts, rump, and hams, loin and back; low in the twist; deep in the brisket; square and level throughout. In fact, as flocky as a Shorthorn, and a most beautiful and useful breed, the mutton uniformly bringing the highest price in market. It is not a mere matter of fancy which leads buyers to prefer Southdown mutton. It is juicier, higher flavored, more like beef, and yet having a full, rich mutton flavor, free from wooliness, and the meat is veined and marbled with fat. There is a greater proportion of lean to fat in well-fatted animals than in most other breeds. The favor in which this breed is held is noticeable from the fact that the gray pates and legs are always left upon the carcasses when dressed for market and hanging in the butchers' stalls, so that connoisseurs may recognize their favorite breed. Mutton of the closely allied breeds Shropshire and Hampshiredowns is generally passed off for Southdown in the market, but the legs and faces of these breeds are of a much darker color.

**Variations in Indian Corn.**—The leading grain crops present excellent illustrations of the

modifying influence of climate; but none better than the Indian Corn. This plant has a wide geographical range, and the time for reaping the crop varies greatly. In its extreme northern range in North America, but two to two and a half months are required for its development, while at the South as many as six months are required. Heller says

THE SOUTHDOWN RAM "STALWART."—OWNED BY S. J. SHARPLESS.—(From a Copyrighted Photograph by Schreiber.)

the time of reaping varies from "seven months to six weeks." Aside from the period of growth, the appearance of the crop varies greatly; only the small varieties are grown at the North, while in the warm climate of the South the stalks are large, tall, and "the ears frequently higher than a man can reach." One of the most interesting features in a collection of corn, made by Professor Miles to illustrate the varieties produced by climate, is the relative size of the cob. "At the North, the cob, as a rule, is larger in proportion than in the southern

THE ELAND OR IMPOFO OF THE CAPE OF GOOD HOPE.

varieties, or in apparently the same varieties grown in the Middle States. At the North, the flint varieties are exclusively grown, while at the South they are entirely replaced by the dent varieties. The smallest, well-developed ear in the collection weighs but half an ounce, while the largest ear turns the scale at one pound and eight and a half ounces." This is a wide range in the size of ears of corn.

### The Eland or Impofo.

The colonists of the Cape of Good Hope have applied the name Impofo to a large animal of the Antelope group of ruminants, found a native in that region. It is also called Eland, and is most commonly known by that name in the various

countries to which the *Orcos canna* has been exported. The Eland is the largest of the South African antelopes, an adult bull measuring nearly six feet in height at the shoulders, with a length of about ten feet from the nose to the base of the tail. In weight the Eland ranges from seven to ten hundred pounds. The general color upon the back and sides is a grayish yellow, with purplish shades shining through. The lower parts are cream colored, while the face is brownish red with a white chin, and a slight brownish mane. The tail is brownish red, and the dewlap yellowish brown pencilled

with brownish red. The horns are nearly three feet long and slope slightly back from the crown, thick at the base, near which they take two spiral turns. The female is much more delicate and elegant in figure than the male, and is of a pale sienna color. When young and not over-fed the Eland is not easily overtaken by the Cape horse. The flesh is peculiarly excellent and is highly appreciated in South Africa where the flesh of most animals is tough. The hide is much prized for leather. Like other antelopes the Eland seems

to get along without water, frequenting the desert localities in herds of a hundred or more, far from rivers and streams, and live there for months without drinking. The Eland has been introduced into England, where it is grown to some extent. The first one killed for the table was in 1859—a five-year old, weighing 1,176 pounds, and was described as "huge as a Shorthorn, but with bones not half the size." The texture of the meat resembles beef, with a venison flavor, and possesses a fineness and delicacy that places it high in the list of nutritious foods. With us the Eland is only a zoological curiosity, but

in its native home it is a handsome wild animal of no small importance as a source of food. There is a striped variety of the Eland, but it is rare. The skins of these animals are considered trophies of success among the hunters, and therefore held in high esteem by them. The engraving is made from a copyrighted, instantaneous photograph, sent us by Messrs. Schreiber & Sons, of Philadelphia.

## Among the Farmers.—No. 59.

BY ONE OF THEM.

### About "Rockeries" or "Rockwork."

There is something distressing to me about what are called "rockeries" or "rockwork." I mean those heaps of stone, and the sham grottoes which are so much admired by some. They either look like stone piles which have been "tidied up" a lit-

Fig. 1.—FOUNDATION OF ROCKWORK.

tle, and made to support some trailing vines, bunches of houseleek, or stone-crop—or they look like a great effort to do something which turns out a lamentable failure. I have seen now and then an artificial bit of rockwork in a corner, well filled in with earth, half covered with creepers, and shaded by some overhanging tree, where ferns and other shade-loving plants seemed to enjoy the moist cool stones and their retired life, which I rather liked.

### A Rockwork Well-curb.

Our old stone house and its surroundings are so rustic, that when we replaced the ancient well-sweep with a modern pump several years ago, there seemed something incongruous about it. We had one pump in the house drawing water through a pipe 80 feet long, but raising it only 12, which was really all the pump we needed, except when we wanted to use the garden hose. So as the platform needed renewing, and we found that the upper stones of the well had been disarranged by the frost, we determined upon a change, and a return to first principles. The well is only about ten feet deep, and is several feet back from the bank which drops off suddenly towards the meadow. I dug out the ground around the well, had the top stoned up to the level of the ground, laid in cement, and a grouting of cement and broken stones filled in all around, making this upper part of the stoning of the well a solid wall, compact as one stone, two ft. wide and high. This foundation is shown in figure 1, which is a perpendicular section of the well.

Fig. 2.—VIEW OF CURB LOOKING DOWN.

For the curb proper we used angular stones of all sizes, the largest as big as a man could conveniently handle, and laid them up with some pains not to make a uniform wall, filling every crevice with cement, and making niches for pots of flowers, and

flat projecting stones for the same purpose, to hold the pots. The curb was drawn in towards the top, and at the height of 2½ feet was finished in a flat surface, no where less than six inches wide, and every seam "pointed," as seen in figure 2, which is a view looking perpendicularly downward.

To provide a place to stand when drawing the water, to set the water-pail, and a spout, two flat stones were laid a little above the level of the ground, and semi-circular places left as the wall was built. At the proper height for the spout, a hewed stone was laid in. When the cement had set, a stone-chisel dressed the standing and the pail places. This dressed stone appears in strong contrast to the rough work all around, and shows evidence of design in the whole. (See figure 3.) In the flat stone supporting the pail we chiseled a basin smaller than the pail, so that it stands firmly. It holds about two quarts of water, and hens, chickens, dogs, and cats, come constantly to drink.

In its summer dress the well-curb—we call it the old well-curb now, looks very well. It is a place where stand a number of house-plants, which remain in the tubs or pots all summer, such as century plants, cactuses, oxalis, the little striped tradescantia, and other such-like things. English ivy has been planted all around, and so has the little pale-green *sedum*, commonly called stone-crop. The ivy is protected at the roots, so that in a severe winter it dies down, but the shoots clamber up to the very edge before midsummer, and the dark-green leaves contrast beautifully with the bright yellowish-

Fig. 3.—SHOWING STANDING PLACE IN CURB.

green of the stone-crop. Besides, there is on one side a bed of gay bedding plants: horseshoe grass, asters, and marigolds; on the shady side a bed of ferns, and on the side of the spout, which is south, a bed of roses receives all the overflow of the well, as also many a bucketful of water which is drawn on purpose to dash over it.

### The Old Well-sweep.

When a well-sweep and bucket at a well, 12 to 20 feet deep are properly balanced, and well set and arranged, which it is easy to do, they form, in my opinion, the best water drawing apparatus that has ever been devised. The bucket in our well is so balanced that a child of eight years can draw a bucket of water, and a grown person can draw water easily with one hand—and very rapidly. The post or crotch is of red cedar, which is lasting, and has a rustic look. The sweep is of chestnut, which dries very light, is stiff, runs straight, and stands the weather a long time without paint; and the pole is of pine—yellow pine is best, but it must be well seasoned, or it will be pitchy in hot weather for some time. White oak or ash are both good if free from knots, straight, and straight-grained. The sweep and the stone-curb are shown in fig. 4.

On a still summer night we can hear the rattle and clatter of chain pumps, the squeak of the patent rig, with the self-filling and dumping bucket, in different directions, and we look with dread upon the modern patent well-curb—and the more we know about them, the better we are pleased with our silent, picturesque, old-fashioned, efficient well-sweep, with its rockwork curb—beautiful even in winter, and always attractive from its cleanliness, and the absolute exclusion of snakes, mice, and toads, which we used to fish up dead, and alive.

### An Adjustable Saw-buck.

Those of us who run small farms near the city change "help" too often for our own good. But we may pick up a good many good ideas from the ways men of different nationalities have of doing things. A Danish man, while working for us, made

Fig. 4.—THE OLD WELL-SWEEP.

a pair of saw-bucks, to be used singly or together, thus adapted to sticks of any length. They have been in use for several years, and are very simply made, see figure 5. Two forked apple tree limbs were taken, and a two-inch hole bored at the proper angle through each; then sticks were thrust through from the lower side, each one with its mate forming a tripod, that always rests firmly upon the ground, while the upper end is a crotch to hold the wood. Both of these tripods together form an adjustable saw-buck which we find very convenient for cutting up stove wood, or for holding lumber and timber of any kind that we wish to saw.

### The Reaper in the Field.

If we were all artists and were seeking the picturesque, then ruins in all their stages would be in order everywhere. The old tumbled down mill makes a fine subject for the painter, but it does not help to make our bread. A country may grow rich in subjects for the sketch book, and at the same time be a poor place for people to live. Ruins are expensive luxuries wherever they are found; but none more so than those that exist on many farms. The farmer that leaves his reaper in the field for the winter, with its four reel arms extended to the four winds of heaven, is doing something for the picturesque; is furnishing an object, which, when the snows of winter come, cannot but strike the eye of every passer-by. With practical persons the question, "Does it pay?" comes boldly to the front. If the machine costs \$140, it will perhaps last five years with such treatment, or cost about \$36 a year, while if carefully housed, it will last at least twice as long, and reckoning interest at 6 per cent, the yearly cost would be \$22, or an expense of \$14, for the sake of the rustic scenery, not to

Fig. 5.—AN ADJUSTABLE SAW-BUCK.

mention the greater expense to run a rusty, warped, and decaying machine, than one in good trim. But it may be said, "It costs to build shelter," and so it does; but \$14 is the interest on \$234, and with the loss on the plows, drills, cultivators, carts, and other farm implements, a good tool house could be built, and more than half of the present loss from exposure be money put into the pocket, besides the appearance of the premises will be greatly improved.

### Culverts under Roadways.

Culverts are arched passages for water under a roadway. Figure 1 is a bridge, though a very small one. Timbers are laid from one pier to the other, and planks are spiked upon them and cover the ends. The piers may be laid up of the roughest stone, and in the rudest way, or of nicely faced and angled stone, as shown in the engraving. This is the simplest and easiest way a brook can be taken under a road; but the planks rot and the timbers give out. There is danger of horses stepping through, and there is every now and then the necessity for new planks or timbers. Culverts are much better for all small streams, and last indefinitely, if well made. The simplest form is really about as much a bridge as a culvert; see figure 2. The same simple piers are spanned by rough, more or less flat stones, long enough to reach solidly from pier to pier. The cracks between them and any irregu-

Fig. 1.—A SMALL BRIDGE.

larities are levelled off with broken stones, and the roadway carried over at any desired height. When flat stones, large enough, cannot be procured conveniently, concrete culverts may be easily made. A very good form is shown in figure 3. Pier walls are laid exactly the width and half the height, of lime or flour barrels, or even sugar hogsheads. Then a line of barrels is laid snugly end to end between the piers, and a concrete of cement, mortar, and gravel, is spread upon them to the depth of four to six inches, if the cement is very strong and good, or to a greater depth if it is not so good. In laying on the concrete, it is well to go

Fig. 2.—A SIMPLE CULVERT.

along one side first, and to set small stones in the soft surface, which tend both to keep the cement in place until it sets, and to give solidity to it. This protection of stones is especially valuable upon the top in case the covering of earth or gravel forming

Fig. 3.—FORM OF CONCRETE CULVERT.

the road-bed is likely to be worn away. Figure 4 is a lengthways section of the crown of the arch, showing how the shape of the barrels causes a succession of depressions, which give an additional strength. This makes an excellent culvert. After

Fig. 4.—LENGTHWISE SECTION OF CROWN OF ARCH.

a week or two the barrels must be removed, for should a freshet occur, the pieces might break away, and form an obstruction which might do

damage. The flatter an arch the weaker it is, and the material must be proportionately stronger or thicker. Figure 5 shows a flat arch, made by spanning between the piers with sticks of timber,

Fig. 5.—FLAT ARCH MADE ON CURVED FRAME WORK.

to hold a round log or other support of desired thickness—say ten inches or a foot. Round or split poles are sprung over this, and the ends brought into position by straight poles nailed or lashed to the timbers near the ends. The surface is made as nearly uniform as possible as to curvature, and covered with flags or leaves, so as to make a surface which will hold the cement. A coat of this should be applied at the outside along the piers, and then, as it grows stiff, farther and farther up. The whole arch should be covered with a coat two or three inches thick, left rough, and when this has hardened, the whole thickness of concrete is laid on as solidly and compactly as possible. If well made, it will form a lasting arch. The timbers may be sawed in two after a while and taken out; the log of course will fall, and the roughness of the under side will be no detriment to the usefulness of the structure.—Figure 6 is a similarly constructed arch, but not arched on the under

Fig. 6.—STRAIGHT-SIDED ARCHWAY.

side, where straight sticks are used in constructing a foundation upon which to lay the concrete.

### Something about Soldering.

Milk pans, pails, and many other tin household utensils, will get leaky and need repairing. Bits of rag and splinters of wood, etc., give temporary amendment in certain cases; but the only permanent method is to use solder. A soldering "kit" consists of a soldering iron of copper, weighing about 12 ounces; a flat 10-inch file, rather coarse; a scraper, and a 3-square file, ground to three scraping edges for an inch from the point. A hottle of soldering fluid will also be required, and a little rosin and some sal-ammoniac. Last, and not least, a few sticks of solder. Directions for soldering: The "Iron" must first be *tinned*, that is, covered with a thin coat of solder. To do this, heat the Iron somewhat above the melting point of solder. File one side of the bevelled portion smooth, and touch it immediately with rosin and soldering fluid, and then with solder, and wipe smooth with a rag. File and "tin" the remaining portion. When done, the surface should be completely covered with solder. Another way is to heat the iron nearly to redness, and rub it upon the sal-ammoniac with solder in contact, when no filing will be necessary. This tinning must be repeated whenever the thin coating of solder is removed by over-heating of the Iron, which is quite likely to occur. Now to the work. Wherever it is desired to attach solder, the parts must be clean. If the surface is not already bright and clean, it must be made so by appropriate means. Here the scraper will generally be of use. Having scraped the surface, apply with a stick some of the soldering fluid, or, instead of sol-

dering fluid, some rosin, to the parts to be soldered. Meanwhile the iron has been heating in the cock stove; not too hot, for then the solder is too fluid and you cannot pick up a portion with the point of the iron. Take the iron from the fire, wipe with a rag, or dip momentarily into a weak solution of sal-ammoniac. Touch the iron to the solder; if the heat is right, a small portion adheres, and is placed upon the spot where it will do the most good. (The tendency to use too much solder should be guarded against.) If the iron is not hot enough, warm it some more. The iron must remain in contact with the place where the solder is to stick until the surrounding parts are at the temperature of melted solder. With the above utensils and directions almost any person can mend a milk pan or ordinary utensil, though there would be much of soldering still to learn. Old tomato cans would be good to practice on until the art is acquired. D. S. L. [See Feb. number, p. 67.—Ed.]

### Living Posts for Wire-Fences.

Persons often inquire if living trees are not available as posts for wire fences. They certainly may be used, but there is great objection to fastening the wire *directly* to the trees. We give two en-

Fig. 1.—WIRE FASTENED TO STRIPS.

gravings; figure 1, showing how it may and ought to be done, and figure 2 giving the result of fastening wire or ribbon fencing directly to the trees. The proper way is to nail on a white oak strip, and it is best to use green wood, for after oak becomes well seasoned and dry, it will be almost impossible to drive staples into it—to this the wire may be attached, and no injury will ordinarily be done to the tree. The growth of the tree may tend to deflect the fence a little from the true line, and in that case the strip may probably be started carefully and taken off free from the tree and nailed on again where desired. It might be worth while to saw off a portion of one end of the strip and only shift the top or bottom wire. That would of course be determined by the situation and appearance of the fence. If fastened directly to the trees, the bark soon closes over the wire and any shifting is impossible, without cutting into the trees, making ugly wounds, or cutting off the wires and leaving them in the trees, where, years hence, the pieces will be likely to be discovered by the woodcutter, and would try equally his own temper and that of his axe. Neither is it best to nail fence strips directly to trees when "living posts" are used for strip fence. It is much better to nail to perpendicular strips attached to trees.

Fig. 2.—OVERGROWN WIRE.

**Cure for a Baulky Horse.**—We have cured incipient haulkiness by persistent gentleness, never overloading, always starting evenly, and easily, gradually increasing loads, and patting and praising the animal after a good pull. This resulted in a complete cure, whether it would cure a chronic case or not we cannot say, but it is worth trying.

### Cow-Barn and Poultry-House.

In Major Alvord's admirable contribution to the little book lately issued on "Keeping One Cow," he gives, with very little comment, the plan of an excellent barn. It was at first a mere carriage-house and horse stable; then changed, by the addition of a chicken house, in a wing; finally it was raised, and a cellar or basement for roots, cow-stall, store-rooms for bedding, etc., calf-pens, etc., intro-

Fig. 1.—SIDE VIEW OF THE BARN.

duced under the main part, while under the wing is an enclosed shed and manure pit. The engravings are made with such detail, that it is easy to see the relations of things. The second or main floor above the basement is chiefly devoted to storage, although adapted to be used for a horse and carriage barn. In the wing upon this floor, the poultry have their quarters, above the manure pit. In the enclosed shed in the basement, very comfortable quarters might be provided for a pet porker. On the whole, it is a plan excellently adapted to the wants of a villager or suburban resident, who wants to keep an unpretentious family establish-

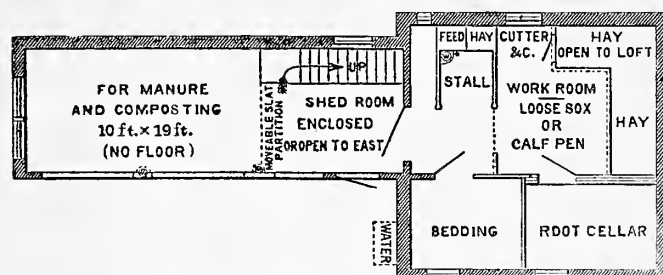

Fig. 2.—GROUND PLAN OF THE BARN.

ment—pony and phaeton, a cow, and some chickens in comfortable quarters, not to mention the pig.

### A Cheap and Durable Cistern.

An abundance of rain water for family use, for the barn-yard, and for irrigation in the garden, is still a great desideratum in our rural districts. The great bar to this water supply is the anticipated expense. It costs money to excavate and line the sides of a cistern with brick and stone. Most farm houses have no provision for washing except well-water, drawn with the bucket, and this is often hard, and the yard and barn-cellar are without any water for stock. A cistern that will hold all the water that falls upon the house, or the barn, is within reach of every thrifty farmer, and will pay for itself every year in saving labor, and in the health and comfort of the family, and in the care of the farm stock. A neighbor of ours, who is a gardener as well as a farmer, built a cistern for his greenhouse last year, and liked it so well that he has built another this fall for his barn and garden. The first item of expense was the labor of excavating on the south side of the barn, where the frost does not penetrate very deep. The excavation is about ten feet deep, ten feet in diameter at the bottom, and twelve feet at the top. The soil is gravelly loam at the top, and compact gravel below. But

sand, if it were compact enough not to cave, would answer just as well. The sides of the cistern are made as even as possible, and a wash of Portland cement is applied with a broom—to the bottom and sides. This dries very rapidly, and four or five coatings will make a perfectly tight and strong basin to hold all the water that will ever fall into it. The cost of the cement is very small, and the thin crust, backed by the solid subsoil, is just as good and durable as mason work of brick or stone.

For a covering he used chestnut timber of one foot in diameter, hewn upon one side, upon which chestnut plank two inches thick were laid. Two leaders conduct the water from the eaves of the barn into the cistern. A man-hole was left at the top large enough for the cleaning of the cistern, and for the insertion of the pump. The plank was covered with about two feet of earth, which is a sufficient protection against frost in this latitude. The cistern will hold 8,000 gallons of water, or more, and will furnish an abundant supply of water for stock, and for irrigation in ordinary seasons. The whole cost for labor, timber, and cement, was about fifteen dollars. Most farms will furnish the necessary labor and lumber, and the only money outlay would be for the Portland cement. This cement will harden under water, and become as solid as stone. It is entirely practicable for almost any farmer to build a cistern of a kind which has been described, and to have a good supply of water for his cattle during the winter. Build a cistern.

### A Well, laid up with Cement Blocks.

Mr. James E. Dean, of Fishkill, sends us the following clear and concise description of his well, and how he made it. It may be of use to many.—"As in some other communities, we are troubled here with sand running in with the water between the stones and filling up our wells, and we are often annoyed by worms, toads, and other small animals getting in and fouling the water. To shut out all these, and also the impure surface water, I prepared a mold, figure 1, which consisted of a frame with

wooden blocks for ends, sheet-iron sides, but without top or bottom. In this I made cement or concrete blocks, similar in shape to the fire-bricks which line cylinder stoves, see figure 2. These blocks are about one foot high, one foot long, and four inches thick, with a groove on one edge and a tongue on the other, and so curved that nine make a complete circle. The well was about three feet in internal diameter, and each course a foot in height. The materials used were one part Portland cement and five parts creek gravel. The mold, figure 1,

Fig. 1.—FRAME FOR CEMENT.

is placed for filling in a bottomless box or frame, figure 3, and wedged in place by the blocks, A, A, at each end. When I had enough of the blocks made, and they had hardened a few days, I commenced my excavation. At about ten feet water was reached, when I prepared a ring, wide enough for the blocks to rest upon. It was made of two thicknesses of inch boards, cut in segments and nailed so as to break joints. This I placed in the bottom, and commenced

building, making the horizontal joints tight with cement, but leaving the perpendicular joints with no cement in them. When we had put on three courses, we dug inside and settled our hoops and cylinder, occasionally pumping out the water until we were about four feet below the water line, which just then was very low in consequence of the protracted drouth. Then we laid it up to and one foot above the surface, carefully filling in the sand on the outside, and put on our well-house, with its axle and drum, and everything was ready for work. The water tastes somewhat of cement, which will soon disappear, when I expect to have the best, as I now have the prettiest, well in this vicinity.

Fig. 2.—A CEMENT BLOCK.

I forgot to say that I put mortices in some of the blocks in each course, for toe-holes to assist in going up and down. To make these I put in a block against the inside iron when the mold is about half full, and tamp the material around it. The water will filter readily through blocks where the proportion of cement is not greater than one to five, though I left the vertical joints uncemented, to facilitate its entrance. If the blocks should not be used before they are six months old, one part cement to eight of gravel would doubtless answer. I sifted the gravel through an ordinary coal sieve, so as to take out the large pebbles, and so make smoother blocks. I would caution parties not to make the material too wet. It should be well mixed while dry, and then only dampened so as to be tamped into the mold, in the same way as moldings are treated at a foundry. A good man can easily make fifty blocks in ten hours, without any assistance. No doubt my arrangement for holding the mold together can be improved.

To give the iron sides of the mold the right shape, I sweep two concentric circles on a floor, and bend the sheet-iron pieces to coincide with each. I

Fig. 3.—THE FRAME SUPPORTED IN A BOX.

then divide the inner circle into nine spaces, draw radiating lines from the center through two of these points, and so find where my end blocks go.

### A Provisional Opening in a Wire Fence.

—"J. B. C.," British Honduras, sends a method of making an opening in a wire fence, that will be of service in our own country, where this kind of fence

A WIRE-FENCE GATE.

is so largely used of late years: "Fasten the wires securely to the left-hand post; procure two clevises for the opposite post, and fasten them through the center of the post with bolts. Secure the wires to a false post, and have the bottom clevis stationary, and long enough to admit the false post, and stretch the bottom wire. The top clevis should be long enough to admit the false post, and also a wedge so as to thoroughly tighten the wires."

### A Fodder Rack for Sheep.

Mr. J. B. Hawley, Hamden, N. Y., sends a very neatly made model of a Fodder Rack for sheep, and says, he has used this kind of Rack for thirteen years, and likes it better than any other that he has seen. It will take to pieces and fold in a very small space, a very important consideration. The compactness of the folded rack is evident from the very closely folded model.

Fig. 1.—THE BOTTOM PIECE.

The bottom pieces, figure 1, are made of two-inch stuff. Two iron pins on each side of the top part hold the rack in position. Two of these bottom pieces are enough for a 12 or 14-foot rack—a much longer rack will need one in the middle. Figure 2 shows one of the end pieces, with three  $\frac{1}{4}$ -inch iron pins projecting to fit in holes that are bored in the center of the end of each of the three boards that make the bottom of the manger. One end of the rack is shown in figure 3. The top and bottom pieces should be two inches square of good timber; bore  $\frac{1}{4}$ -inch holes, 9 inches from center to center, and fit 24-inch rods in all the holes but the end ones. One side of the rack is shown in figure 4; its construction is the same as the ends, with the exception that the rods are not so close together, and the end rods are longer than the others and draw out so as to be used to hold the rack together. The bottom pieces and manger may be of undressed lumber, but the whole rack that stands on the manger should be of good timber, like oak or ash, carefully dressed and cornered so as not to catch the

Fig. 2.—END PIECE.

Fig. 3.—END OF RACK.

wool. The rack complete is shown in figure 5. In use, the sheep put their heads through the rack, and eat from the manger much as cows do in stanchions. Mr. H. is satisfied that this rack will pay the expense of making, in one winter, rather than feed on the ground, as most farmers do in his section.

### The Care of Sheep and Lambs at Yeanning.

It used to be considered a calamity to have lambs come in the winter or early spring. Three-fourths, at least, of all that were dropped before April died, and their carcasses were food for crows. The sheep took their chances in the same yard with cattle, and often had not even the shelter of a shed. This "slaughter of the innocents" was not strange, as they were dropped upon the frozen earth, and had little care of the flock-master. With suitable quarters, and care, it is not difficult to save winter lambs, and the advantages of an early start and an early market are so great, that many of the best sheep men, who cater for the hutchers, plan to have the yeanning time commence as early as the middle of February. Even in the Northern States, to be successful with early lambs, it is essential that the sheep should have quarters by themselves. If

Fig. 4.—ONE SIDE OF THE SHEEP RACK.

left to run with other animals, they are exposed to many injuries, and not infrequently the lambs

will be prematurely dropped, or still-born. The quarters should be in a sheltered position, with the full benefit of the sun. A large open shed facing to the south will do, or a barn cellar, if perfectly dry and kept well littered. One of the best flock-masters we know of has a barn about 40 by 20 for the accommodation of fifty sheep. He thinks it of a good deal of importance that the sheep have a board floor under them. This floor is kept well littered with straw. The sheep are fed in this barn, and kept in it at night, and during stormy and severe weather. There is a comfortable dry yard attached to the barn, and in this they have their liberty in mild, sunny weather. Another essential thing is the seclusion of the sheep at yeanning time, that the mothers may not be disturbed in their care for the lambs. A row of small pens upon one side of the barn, about four feet square, answers a very good purpose. The ewe should be kept in one of these pens for three or four days until the lamb has learned to nurse, and can follow the mother. The utmost vigilance is needed during the whole of the yeanning period. Six times a day is none too often to visit the flock, and look after the lambs. It should be the first thing in the morning, and the last thing at night, and in critical times, where many lambs are expected at the same time, it may be necessary to have a night watch and visit the fold every two hours. Ordinarily the ewe needs no assistance, and the more quiet she can be kept the better. Sometimes a little timely aid saves the life of both mother and lamb. Such ram lambs as are not wanted for service can be altered more safely when three or four days old than at a later period. Sheep want a portion of green succulent fodder during the winter. Nothing is better for this purpose than turnips.

**Barn-Yard Manure vs. Artificial Fertilizers.**—Unless the special wants of any given soil are well understood, barn-yard manure is much more reliable than any special fertilizer. The manure, when well made in the yard, furnishes all the elements, that are or can be lacking in a soil, and in

Fig. 5.—THE FEED RACK COMPLETE.

a very acceptable form. But the question may be asked: "How are we to know the special wants of our soil?" This must be answered by direct experiments; and in putting this question to the soil it will be necessary to follow much the same plan as that proposed by Prof. Atwater in the *American Agriculturist* for April last—a plan that many are now following with satisfactory results. It is only by similar, thoroughly conducted experiments that the special wants of any soil can be discovered, and when once known, the remedy in special fertilizers is comparatively easy. The great question is:

What does the soil need? This answered, more than half of the work of securing good crops is done.

### Handling Heavy Hogs at Butchering.

Mr. Geo. W. Bronson, Oneida Co., N. Y., sends a sketch and description of his method of handling heavy hogs. Mr. B. writes: "It may be of use to some of your subscribers who may be (as I am)

Fig. 1.—EASY METHOD OF HANDLING HEAVY HOGS.

too old to enjoy a heavy lift on a 'porker' of four or five hundred pounds. Having a lot of this kind to handle from year to year, I made the arrangement shown in figure 1. The hogs are scalded in a box, which is an improvement over the half hogshead or large kettle, as it takes less water and scalds the whole hog at once, thus avoiding much lifting that is necessary when only half of the hog is scalded at a time." A table for scraping is placed beside the scalding box, and a track is arranged beyond the table and overhead, with two pulleys fastened to the rafters above, and near the ends of the track. A rope passes, from the hog to be raised, over these pulleys and down to a windlass attached to the floor as shown in the larger engraving. Mr. B. describes the use of the arrangement as follows: "The hog is taken from the pen, driven to or near the door of the dressing room, stuck and kept as near as possible in the same spot. When dead, take the hook attached to the windlass, and use it as a hog-hook. A man at the windlass soon brings the hog upon the plank at the end of the scalding box, where it rests until the water is ready, and is then put into the scalding box. When to be removed, the 'man at the wheel' soon lands the hog upon the table again. After being scraped, etc., the gambrel is put in place and the hook in the end of the rope placed near its middle, when it is hoisted up to the hook attached to the movable block. [The hook and sliding block is shown separate in fig. 2.—ED.] When the hog is finished off, the man turns the wheel, and the block with the 'porker' attached is moved along the track as far as it is necessary. The track is made of scantling, fastened to the joist above, leaving a space of two inches between for the passage of the hook which runs downward from the movable block. The blocks have a two-inch notch removed to keep them in place on the track. The size of the wheel-shaft is five inches; horse hay-fork rope and its pulleys will answer for the work above described."

Fig. 2.

**Little Things of Great Moment.**—It is a small matter to take the horses across the field for their water; it seems to cost nothing, yet if a farmer's time, or that of his hired man, is worth anything, it costs a great deal in the course of a year. It is a small matter to chop each day's wood upon the day it is used, and thus have it all fresh; but fifteen minutes in harvest time is worth more than in January; besides, there are vastly more economical methods of making fire wood than with an axe. It is a very little matter to tighten a loose nut, but it sometimes costs life and limb

not to do it. A pear tree here, and a peach tree there, cost so little that one is inclined to think they are of no account, but when the fruit is ripe they are appreciated. A single step from one room to another is "only one step," but the thought of a stairway made out of these steps during a life time, is enough to almost make a woman's back ache. Look well to the details, and see that the little things are right, for it pays in the end.

### A Convenient Ash Box.

"W. M. V.," Glen Cove, L. I., sends a sketch and description of an Ash Box which he has had in use

Fig. 1.—A CONVENIENT ASH BOX.

for a number of years. The Box can be made of cheap hemlock lumber, and of a size that the lumber at hand will cut without waste; seven feet in length by three feet in width, and four feet high, may answer in most circumstances. A lid, *A*, is provided occupying nearly one-half of the top, as shown in fig. 1, and also a side door, *B*, used for removing the ashes. Two strips of board are fastened within, and lengthwise of, the box, upon which the sifter or sieve rests as it is shaken, as shown in vertical view in fig. 2. The sieve, which is an ordinary one, costing perhaps twenty-five cents at the store, has a long handle fastened to it; with this the ash box and sifting apparatus is complete. The advantages claimed by Mr. V. for this ash box are: The ashes can be sifted without making any dust, as when the lid is closed the whole is confined within the box. The ashes and sieve are kept from exposure to storms, and the latter is always in place and ready for use. It dispenses with a disagreeable looking heap of ashes often found on exhibition the year round; and lastly it is cheaply and easily made. Any further description of the construction of the ash box or the method of working the sifter, is unnecessary. It may be added, however, that as the structure is of wood, care should be taken that there be no live coals among the ashes when they go to

Fig. 2.—CROSS-BARS AND SIFTER.

the ash box. A coat of paint, or even whitewash, will add to the appearance of this useful and economical article and at a very trifling outlay.

### Muck and Peat Pay.

The use of muck and peat pays abundantly, and we notice that the man who has once fairly experimented with these fertilizers in the compost heap rarely abandons them. They are soundly converted to the use of these absorbents, and every dry spell in summer and autumn finds them delving in the swamps and peat bogs. There is the fruit yard where we began using peat in the compost twenty years ago still fat and flourishing, and bearing abundance of the finest fruit every year. For ten years, peat, composted with stable manure, was applied without stint, and the roots have an abundant supply of food. There is the large farm and nursery of our neighbor that has been dosed with muck compost for twenty-five years, and he keeps straight on digging and composting as if it was the only way in which he could make his soil yield paying crops. No better nursery trees are raised in the

State, and his orchards are models of clean, well-fed, productive trees. He has plenty of fruit when others fail. Tens of thousands of loads of muck have been incorporated with the soil, and the crops never fail from lack of nourishment. There are two brothers just beyond who follow fruit and truck farming, and have a yearly income of from fourteen to twenty thousand dollars a year from their two farms. We never fail to find, at this season of the year, a compost heap of enormous proportions close by their barns. The best farmers we know of who have the facilities, are using peat and muck largely, and are extending the use. This fact is about as good an advertisement of the value of these absorbents as could possibly be had. They are a good dressing for all light gravelly or sandy soils, without any amendments. They are most economically used probably for making compost heaps upon the fields that are to be broken up next spring. Any active green manure from the yards, stables, or the neighboring market town, are good for these heaps, in the proportion of one load of manure for four or five of the peat. The yard and stables should be abundantly supplied with them, and it is always time for more peat when the smell of ammonia is perceptible. Near the shore various kinds of sea-weed make an admirable compost with peat. Fish scrap is still better, either raw from the factory, or dried, and at least ten parts of peat to one of the scrap may be used to advantage. Oyster-shell lime, fresh from the kiln, makes an excellent compost with peat or muck. Wood ashes are still better, and those who live near villages are still able to procure these in considerable quantities. It matters little what agent is used to throw the heap into a ferment, and decompose the vegetable fibre. After twenty-five years of persistent use of muck and peat in the compost heap, we have abiding faith in their great value as fertilizers.

### Trucks for Boats—Two Kinds.

"D. S. L.," Charlestown, Mass., has a boat which he keeps in a house a short distance from the bay,

Fig. 1.—A TRUCK FOR A BOAT.

and employs a Truck for moving it from the storehouse to the water. This Truck is constructed as shown in fig. 1. The wheels are of maple, two inches thick and eight inches in diameter, united by an axle made of gas pipe, one foot in length. A piece of spruce, 4 by 4 inches square, rests upon the axle, to which the top pieces or "wings" are bolted. The wings are 3 by 4 inches square, built to approximately fit the boat, with a space left between them for the keel of the boat. The dimensions will of course vary, according to size of the boat. The wheels might be smaller, if the course to be run over is perfectly smooth, and larger if the roadway is rough. They should be quite near together so as to secure proper stability, and diminish as much as possible the tendency to twist around. The same gentleman sends another form of truck, which is very good when it is to be

Fig. 2.—FLAT-TOP BOAT TRUCK.

used on smooth planking only. It consists of a board of a suitable size to give good support (12 by

18 inches) with a roller fixed beneath, something like a bread-board and rolling pin, as shown in fig. 2. With some such truck as this, or the one shown in fig. 1, a boat can be easily moved over any land that is reasonably smooth or other hard surface.

### Another Small Barn.

"T. H. R., Jr.," Dayton, Ohio, having seen the "Plan for a Small Barn" in the September *Agriculturist*, page 349, sends a plan of his barn which

Fig. 1.—A SMALL BARN.

he has recently built. He thinks it preferable for a small place to the one given in September, "as it will cost less, being smaller and yet sufficiently roomy for two horses, or a horse and a cow and two vehicles, besides presenting a better appearance. It also obviates the necessity of going behind the horses when feeding, which is often desirable, as in families having no hired help the feeding is sometimes intrusted to the children." The outside appearance of the barn is shown in figure 1, and is certainly pleasing to the eye. The ground floor, figure 2, is 18 by 24 feet, 8 feet

Fig. 2.—FLOOR PLAN OF BARN.

The carriage room, *C*, is 13 by 18 feet, with sliding doors 10 feet wide. The horse is led through the door *D*, from the carriage room to the stable. The box, *E*, containing food, connects by two "spouts" with grain bins in the loft. The

hay "shoot" is shown at *S*, and is between the mangers. The harness closet, *H*, is placed under the stairway. A window, *W*, gives light to the feed room and the stalls. The loft, figure 3, is 6½ feet to the plates, and with a three-quarter pitch to the roof there is ample room for hay and straw. The barn is built of hemlock, sided with ¾-inch dressed boards, 12 inches wide, and battened. It cost, complete and painted, \$200.

Fig. 3.—PLAN OF THE LOFT.

**Dairy Farming** consists of the feeding of cows for the production of the largest quantity of the richest milk, either for direct sale or partly for making butter and cheese. It takes the forms in summer of grazing on natural or artificial grasses, and housing in winter on hay and roots, or soiling near towns and cities where the food is grain refuse from the breweries and cut green fodder. The surplus stock of bull calves is sold for veal, while the best heifers are kept to maintain dairy stock. This is a very safe system of farming, there being immediate returns on a small or moderate capital invested. The expense of cultivation is small, the farm being kept seeded down with artificial grasses

requiring only the seeding implements, a machine for cutting and raking the hay, and a few of the smaller implements for the cultivation of roots to be consumed by the milch cows. The best breed of cattle to keep depends on circumstances. The Ayrshire is generally considered as giving the greatest flow of milk on a given amount of food. The milk of the Jersey, however, is the richest, so if butter and cheese making is the object they are the most profitable. The milking and management of cows is one of the most important considerations in dairying, and the utmost cleanliness should be preserved in everything about the stables and the milk house. ONTARIO.

### Wooden Shoes for Horses.

Mr. M. F. Hughes, in charge of the large "Chandler Farm," near Lansing, Mich., sends sketches of the wooden shoes which he has used on his horses

Fig. 1.—WOODEN SHOE.

for the past year. Much of the farm land is low and of a miry nature, and after heavy rains it is impossible to use horses for mowing and drawing the hay unless shod in the way here given. The horses are shod in the usual manner, and under each shoe a wooden plate is placed, made of elm plank, one and one-half inch thick, twelve inches long,

and ten inches wide. The corks of the shoes, which should be pretty long, fit into small mortises in the wooden shoe. "The shoe is held in place by a hand passing over the front of the foot, below the quick of the hoof, and fastened to the shoe by a small bolt on each side of the foot, about two inches back of the center of the shoe. The band is made of light band-iron, one inch wide." With these "snow-shoes" the horses are able to go upon the miry or

Fig. 2.—THE SHOE IN POSITION.

soft land with safety. The upper surface of the wooden shoe is shown in figure 1, and a side view, with the horse's foot in place is seen in figure 2.

### Young Chickens and Insects.

The practice of excluding chickens from the garden, especially in mid-summer, is bad both for the chickens and for the vegetables. The young chicks will not thrive in confinement, as in freedom, and the growing plants are in a good measure protected from insects by the chickens. We have never succeeded better with young broods than by putting them, with the mother, in the vegetable garden. The mother is kept confined in a coop, and the chickens have free access to her through the slats. She follows her instincts in scratching over the ground under the coop for worms and grubs, and after a few days the coop is pushed along to new soil. The chickens are regularly fed with scalded meal, or boiled screenings; they supply themselves with animal food from the garden. The chickens are too small to do any harm to plants that are well started, and yet they pick up an immense number of insects. The more highly a garden is manured, the more rapidly do insects multiply, and the greater

is the need of birds and fowls to keep them in check. The chickens can go beneath cucumbers, squashes, beans, tomatoes, etc., and pick the eggs and worms from the underside of the leaves, where they are generally found. They eagerly chase every moth and bug that flies, and if one alights within striking distance, it is sure to be devoured. When the chickens are large enough to do injury to the plants, they are easily removed to other quarters.

### Hints and Helps for Farmers.

**A YOKE FOR A SUCKING COW.**—"A Subscriber" sends a sketch of a device which he has found effectual in preventing a cow from sucking herself. It consists of two frames, one for each side of the neck, which resemble short ladders, and are made in much the same way. These frames are fastened on by means of a sheet of leather or heavy cloth

Fig. 1.—A YOKE FOR A SUCKING COW.

over the top of the neck, and two straps which buckle underneath, as shown in figure 1. Brads, made of nails, are fastened in the rear ends of the horizontal pieces of the frames, which prick the cow when she bends her neck too far to one side.

**A GOOD STABLE TIE.**—Mr. "D. C. K.," Carbondale, Pa., sends a model of a convenient and cheap Cattle Tie, and writes as follows: "Our Tie is made of three-eighths inch rope, which is braided into an iron ring, sliding freely up and down a post set close to the manger or feed-box. There is a knot or frog on one end and a loop on the other. The ends pass on each side of the cow's neck, and the knot is slipped through the loop which may be made tighter by twisting. Similar fastenings made of chains with snap hooks may be bought at the hardware stores, but such an one as is here described will last a long time and answer every purpose of a good Cattle Tie, shown in figure 2."

Fig. 2. THE TIE.

**A SPRING CATCH FOR GATE.**—"G. S. T.," Dutchess Co., N. Y., makes use of old wire springs in the method shown in figure 3. The catch is fastened by a single bolt, and is movable. The spiral wire

is so fastened to the catch and post so as to allow the catch to descend when the projecting bar of the gate is passing over it, and be again brought up when the notch in the catch is reached. The catch is prolonged on the opposite side into a handle, and by lifting on it the other end of the catch is lowered, and the gate is ready to open.

**A BROOM-CORN SEEDER.**—"S. E. V.," Bluffton, Ind., sends a sketch and description of an instrument for removing the seed from the brush of the broom-corn. It is made by taking a thin board

about two feet long by ten inches wide, sawing into its end lengthwise at frequent intervals—the cuts being six inches in depth.

The points of the strips are then sharpened, giving a saw-like edge, as shown in figure 4. The board thus made is fastened to a piece of timber so that it will lean away from the

Fig. 4.—BROOM-CORN SEEDER.

operator, and the instrument is complete. In using the Seeder, the brushes of broom-corn are struck upon the teeth and drawn towards the person at work.

**A SIMPLE WAGON JACK.**—"G. S. T.," Dutchess Co., N. Y., sends a sketch and description of "a light serviceable Jack, fig. 5 which suits perfectly." It is for use in oiling light buggies. It is a "stand," rather than a Jack, as the wheel is lifted by one hand while the instrument is adjusted with the other. It is made of pine, furnished with three rests of different heights, and provided with a bottom of sufficient size to be stable. Such a rest is simple, easy to work with light wagons, quickly made, and takes up but little space when not in use.

Fig. 5.—SIMPLE WAGON JACK.

**GARDEN MATTOCK.**—Desiring an implement for destroying weeds in my garden, I made a light mattock of an old ship carpenter's adze, by having the blacksmith weld a piece of cast steel to the poll, and sharpening it into a pick point. The blade was slightly straightened, being originally too much curved. The handle, made of tough ash, was first planed square, and of the proper taper, and then chamfered off, from near the head, until it was nearly round. The handle being forty-four inches long, makes this a desirable and easy tool for garden use.

J. L. T.

**Tansy Tea for Insects.**—"C. C. K.," Naples, Ill., writes: "Our cucumber vines began dying very suddenly, soon after they came into bearing, and millions of fleas or Aphides were discovered on them. The adult insects were tiny black things, the young ranging from creamy white, through the shades of brown to black. One of my neighbors told me to sprinkle the plants with Tansy Tea, and it would save them. She had tried it on her vines and found it a success, while many of her neighbors had lost their vines. I had twenty-six hills to begin with, and about half of them had died, and were burned immediately, but one dose of strong tea (a three-gallon kettleful of Tansy sprouts covered with water and boiled), poured

Fig. 6.—A GARDEN MATTOCK.

over the vines through the rose of a sprinkling-pot nearly cleared the vines. It was applied in the evening, and the next morning very few were discovered, and those few took their departure for parts unknown after another application. I could find none of the insects anywhere, dead or alive: not even on the ground under the vines."

### A Gate with Two Latches.

"J. B. C.," British Honduras, sends a sketch and description of a Double Latched Gate, and writes: "This gate is very convenient where hogs are to be provided for as well as cattle. Two latches, of the same size and length, and fastened on the gate the same distance from the end, are connected together by a strip of plank fastened with two small screws, so as to allow it to work easily; the catches are placed so that both latches are fastened exactly alike. If the latches are placed on the bars of the gate they are not so likely to be opened by animals. A very convenient lever for opening the gate while on horseback, is shown in the sketch; place a strip of plank level with the top bar of the gate, by

A DOUBLE LATCH GATE WITH A LIFTER.

means of a pin or large screw through the center. Connect one end with the latches by means of a wire, the other end having a raised part, so that by pressing down on this part of the strip, the latches will be brought up out of the catches."

### Science Applied to Farming—LXII.

#### More About Roots of Plants.

The accompanying engravings illustrate the development and extent of the roots of the Sugar

Fig. 1.—A YOUNG BEET PLANT.

Beet. Like those of the potatoes and corn, in the late numbers of the *American Agriculturist*, they are copied in reduced size from photographs taken from nature by Dr. Thiel, in Germany. Figure 1 shows the very young plant, with only a few fine fibrous roots.—In figure 2, which is on a much more reduced scale, the fine roots have increased in number, and extended in all directions, while the main "tap-root," which makes the beet, has attained some size. In figure 3, which is still further reduced, the beet has grown much larger, and the roots have extended further and deeper. That less of the fine roots appear in this picture, is due in part to the difficulty of representing them in so small an engraving.—Figure 4 shows the matured plant, with the long root, which extended five feet into the earth, looped up and fastened, so that it might appear in the photograph. Here, as in figure 3, the finer roots do not appear.

#### Extent and Depth of Roots.

I have often been interested in noting the ideas most people have as to how far and how deep the roots of plants extend. The majority guess roots of grass and clover penetrate between five and ten inches, and are surprised to find that they reach several feet. I have some roots of timothy, clover, and other plants, dug from a very heavy clay soil, a good quality of brick clay, so compact and hard that a sharp knife in cutting it leaves a surface as smooth and shiny as it would on the end of

a pine board. I have traced the roots of the timothy to a depth of two feet and four inches and the clover three feet and two inches. A number of years ago a very intelligent German farmer, named Schu-

hart, made some very interesting observations upon the roots of plants as they grow in the field. An excavation five or six feet deep or more, was dug in the soil so as to have a vertical wall. Against this wall a jet of water was played by means of a garden sprinkler; the earth

Fig. 2.—SHOWING FIBROUS ROOTS.

was washed away, and the roots of the plants growing therein laid bare. The roots thus exposed in a field of rye, in one of beans, and in a bed of garden peas presented the appearance of a mat or felt of white fibres, extending to a depth of about four feet.

Roots of wheat sown September 26th, and uncovered the 26th of April, had penetrated three and a half feet, and six weeks later about four feet, below the surface. In one case, in a light subsoil, wheat roots were found as deep as seven feet. The roots of the wheat in April constituted 40 per cent of the whole plant. Hon. John Stanton Gould, I believe it is, says that he "has seen the roots of Indian corn, extending seven feet downward," and Prof. Johnson states that "the roots of maize, which in a rich and tenacious earth, extend but two or three feet, have been traced to a length of ten or even fifteen feet in a light, sandy soil." Roots of clover, when growing in a rich, mellow soil, extend far, both laterally and vertically. Prof. Stock-

Fig. 3.—BEET ROOT, HALF GROWN.

bridge "washed out a root of common clover, one year old, growing in the alluvial soil near the Connecticut River, and found that it descended perpendicularly to the depth of eight feet." Lucern roots are stated to reach a depth of twenty and even thirty feet. Alderman Mechi, in England, tells of a neighbor who "dug a parsnip which measured thirteen feet six inches in length, but was unfortunately broken at that depth."

Trees, of course, send their roots further and deeper. "A British officer in India reports that the roots of a leguminous tree is often dug in that country for economical purposes, and that he has seen an excavation sixty-nine feet deep made for such a root without reaching its lower extremity." Dr. H. A. Cutting, State Geologist of Vermont, writes me that he has examined the root of an elm, "dug out of the soil in Burlington, Vt., thirty-five feet below the surface." He also writes of seeing "elm roots taken from a wooden aqueduct in Randolph, Vt., 375 feet from the tree." The aggregate length of the roots of plants has been estimated by a number of observers. Thus, Dr. Hellriegel calculates the roots of a vigorous

barley plant to have a total length of 150 feet, while the roots of another barley plant, in a coarse-grained compact soil, amounted to only 80 feet.

The roots are as important to the growth of plants, as the stems, leaves and fruit. But they are covered up in the ground, where we can not see them, nor do we appreciate their forms and uses until we study them carefully. And because we do not understand about them we neglect and injure them. Often the soil is wrongly tilled, or left untilled, the best growth of the roots is prevented, and their power to gather food for the plant diminished. Fertilizers are frequently so applied as to be accessible to but few roots, and therefore are but partially utilized. Thus through error born of ignorance we lose the produce we ought to have.

Nor is the advantage we may gain from such study as that of roots, limited to the pecuniary profit it brings. Knowledge is valuable for itself, and its highest usefulness rests largely in its effect upon its pos-

sessors. I often think that one of the greatest benefits that can accrue to the tiller of the soil is that which comes with a clearer appreciation of the wonderful processes by which nature furthers his work. We are far too prone to "grovel here below;" and need to be lifted up into a clearer, healthier, intellectual atmosphere.

The man to whom a clod of earth is a clod of earth, and nothing more, is himself a narrow man; but as the soil becomes to him a laboratory, where a Divine Intelligence has set grand forces at work, and keeps them in operation in rhythm with all of Nature's harmonies, he will find his thought enlarged, his life inspired, and himself made thereby a stronger, better, and more useful man.

But here I am at the end of my allotted space, and many interesting facts about roots, and their practical application in the tilling of the soil, the application of manures, and the rotation of crops, are untouched. More next time. W. O. ATWATER.

Westleyan University, Middletown, Conn.

Fig. 4.—FULL-GROWN BEET.

**Throwing Sawdust into Rivers.**—In answer to a question on this point, Professor Baird, Commissioner of Fish and Fisheries, writes us: "The practice is everywhere considered as extremely prejudicial to the fisheries of a stream, as the dust gets into the gills of the fish, and produces discomfort and disease; and settling to the bottom of the rivers, it covers the gravel and spawning grounds, preventing the eggs, especially those of the salmon family, from being properly treated."

### The Sensitive Brier.

Southern readers of the *American Agriculturist* frequently send specimens of a plant with sensitive leaves, asking if it is the true *Sensitive Plant*, and if it is not, to give them the common as well as the botanical name. This is not the real Sensitive Plant, *Mimosa pudica*, but closely related to it, and is known as the Sensitive Brier, *Schrankia uncinata*.

THE SENSITIVE BRIER (*Schrankia uncinata*).

The true Sensitive Plant is an annual, about two feet high, with compound leaves, the leaflets of which close upon the slightest touch. This is now quite common in cultivation, being grown simply as a curiosity, and not for its flowers, which are not particularly attractive. The plant illustrated above is like the true Sensitive Plant, in having sensitive foliage. It is a perennial, found in sandy soil from Virginia southward; and is a long trailing vine, with prickly stems and very fine handsome foliage. The flowers come from the base of the leaves, and are in little balls about half an inch in diameter, of a pretty rose color, and appear abundantly throughout the summer and autumn months. For some time we had attempted to grow the plant in the garden, but every winter it was lost; in spring the root would be found completely rotted, and we began to think the climate was too severe to grow it successfully. Finally, a friend sent a root of it from Texas, and as a last resort, it was planted in an elevated portion of a little rockwork then just built. The plant grew finely the first season, and gave an abundance of flowers. The next winter proved a severe one, and in the spring we anxiously looked for the appearance of the Sensitive Brier. Nothing of it was seen, however, and it was supposed that the last attempt had resulted in a failure. But about the middle of May we one day saw a little shoot coming from the spot where the plant was put, and it soon started into a vigorous growth. For the last three years this plant has

proved hardy, and though quite late in starting, has never failed to give an abundance of flowers. To those readers, who desire to grow this really beautiful trailer, it is suggested that they try the method of giving it a spot raised above the general level where water will not settle around the root and cause it to rot. A "rockery" or rockwork is one of the least expensive methods of successfully propagating many of our wild plants; in

*L. Chapmani*, (a), and *L. punctata*, (b). The former grows to a height of two or three feet, forming a spike of beautiful pinkish-purple flowers two feet long. The flower stem is slender and graceful, and there is a neat and handsome look to the whole plant, which at once attracts the lover of beautiful flowers. A bed of this species commenced to bloom in September, and is still very fine at this date (Oct. 22). There is, however, one drawback to their cul-

TWO BLAZING STARS (*Liatris Chapmani*, (a), and *L. punctata*, (b).

fact, it makes a wild garden, when filled with an assortment of plants from the woods, that is highly pleasing to every lover of native flowers. For the cultivation of the shy, early blooming, and delicate plants, there is nothing that quite equals a pile of rocks with "pockets" of earth here and there.

### Blazing Stars—*Liatris*.

The increasing taste for the cultivation of Hardy Perennials has brought into notice many of our choicest of native flowers. There are no more beautiful wild flowers in any country than can be found in different portions of this broad land, and the *American Agriculturist* has been foremost in bringing into notice many of the most desirable kinds. That wild plants are extensively sought for in Europe, shows they have merit, which many of our own people fail to observe until they see them in the gardens, and learn that they are easily cultivated, and are as showy as many of the choicer and high-priced novelties. It is a lamentable fact that most of the native plants of the United States have been introduced through the medium of foreign seedsmen and florists. The genus *Liatris* contains several of the most beautiful of our wild flowers. There are about twenty species; one half of this number being natives of the Northern, and the remainder of the Southern States. We have had thirteen species under cultivation at different times, but none more showy than the two given in our engraving,

which may discourage some from attempting to grow it in the Northern States; it is not hardy enough to withstand our winters. The roots, like most species of *Liatris*, are tuberous, and before freezing weather sets in, they may be lifted and stored perfectly well in dry leaf-mould in the cellar. *L. Chapmani* is only found, as far as we are aware, in Florida. It was named in honor of Dr. A. W. Chapman, the zealous botanist of the Southern States, who has done so much to increase our knowledge of the plants of the State of Florida.

The other species, *L. punctata*, is found in Arkansas and Texas, and is so called from the punctate or dotted leaves. The root is tuberous, and considerably larger than in *L. Chapmani*, the leaves are long and narrow, very stiff and sharp pointed. The stems grow to a height of two to three feet, and the flowering portion is often a foot and a half in length, densely covered with beautiful reddish-purple flowers. These flowers open about the middle of September, and last until the middle of November, the frost having no effect upon them. A row of these plants, nearly 200 feet long, is now in its prime, and it certainly is an interesting and beautiful sight to see these plants blooming while nearly all other flowers have entirely disappeared. This species, though a native of Texas, is entirely hardy in this vicinity, and withstands our severest winters without protection. Among other species of *Liatris*, which are worthy of cultivation, is *L. spicata* the earliest flowering species, blooming in July

with short, very dense spikes of purple flowers; this is followed soon after by *L. pycnostachya*, which grows in rich soil to a height of five to six feet, with a flower-spike four to five feet long. Following this are *L. cylindracea*, *L. graminifolia*, and *L. scariosa*, the last, a quite common kind, being very different in the flower cluster, appearing in the form of buttons, whence it is often called Button-Snakeroot; then last the dwarf and very showy *L. elegans*. This grows to a height of about eighteen inches, the flowers first being of a dark purple, finally changing to white. The above species, with the one exception noted, are all hardy, and we trust our readers will transfer some of them to their gardens.

The Wax-work or Climbing Bitter-sweet.

The Wax-work (*Celastrus scandens*) is one of our most beautiful climbers, both for its fine foliage

THE WAX-WORK OR CLIMBING BITTER-SWEET (*Celastrus scandens*).

and the showy, orange-colored, round pods which open by three valves in autumn and expose the scarlet pulp which surrounds the contained seeds. These little pods, of the size of peas, which hang in graceful clusters of 10 to 25, are very lasting, and when gathered at the right time—just before they open—will retain their attractiveness throughout the winter. Their beauty in home decoration is now so well understood by the people in cities, that scarcely a pod is allowed to fully ripen, so rapidly are they gathered up by boys and others, who sell them in small bunches upon the streets. Those who live where the wax-work grows and have never gathered it, should secure some of the fruit to use in winter bouquets. The accompanying engraving shows the form of the cluster and the opened pod, but, of course, fails to give the rich and attractive coloring of the different parts. The leaves of the Climbing Bitter-sweet vary from egg-shaped, to elliptical, with deeply notched or serrate edges, green above and lighter below. The

flowers are inconspicuous, yellowish-green, and somewhat fringed. As seen growing over stumps and rocks, and into the tops of tall trees, the Bitter-sweet is a shrub full of grace and beauty, and especially so in autumn, when the highly colored berries, in rich clusters, stand out in bright contrasts with the dark foliage of the cedar, and other trees, upon which this climber is often found.

The Pear and Peach Blight.

BY PROF. T. J. BURRILL.

In very many examinations, during three years, of portions of pear trees suffering with the disease usually known as Fire Blight, I had noted the presence of the minute organisms which we commonly call Bacteria. But as these living things are so generally found in decomposing organic materials, and as they had never been considered active agents in producing disease in plants, whatever their relations may be to the contagious diseases of animals, little heed was given them in the search for a parasitic fungus to which the disease might be attributed. The failure to find such an agent, together with the gradually accumulating evidence of the aggressive character of Bacteria in animal diseases, finally called closer attention to them as the cause and not the consequence of this terrible scourge of the orchards. In June, 1880, careful investigations with this end in view were begun. The Bacteria were found to be the same, so far as a microscope with a power of one thousand diameters, and the best known definition could reveal, in every blighting portion of pear and apple trees examined. The change in the tissues was likewise found to be identical in all cases. The cell walls were left intact, and the protoplasmic material remained until the tissues began to shrivel from drying; while, on the contrary, the starch granules stored in the cells gradually disappeared. This was especially the case in the cells of the bark. My colleague, Professor Weber, determined for me that carbon dioxide, butyric acid and hydrogen were the products of the fermentation, which, as was readily proved, took place in the still living, but diseased bark. On July 1, 1880, experiments upon healthy trees were begun, by inoculating them with the Bacteria obtained from trees, in which the disease was in active progress. Most of the inoculations were made by inserting a sharp-pointed knife or needle smeared with the

living Bacteria, into the bark of limbs upon healthy trees, and day by day careful records were kept of the results. In numerous instances the virus was applied to the exterior of the bark, or to uninjured leaves, without developing the disease in a single instance. The following table shows the per cent of the successful inoculations, as became apparent up to and including August 14, 1880:

No. of Experiments.	Kinds of Trees.	Virus from Pear.	Virus from Apple.
36	Pear.	54%	72%
29	Apple.	30%	Not tried.
4	Quince.	100%	Not tried.

The virus from the diseased apple tree is considerably more effective than that from the pear, but this most probably is due to a combination of causes now unknown. It, however, pretty clearly indicates the identity of the so-called Fire Blight of the pear, and that very prevalent disease in the Western States known as Twig Blight of the apple.

The last is a misnomer, because the disease affects the trunk as well as the young shoots, and not unfrequently causes the death of the whole tree. But it does not appear to run from the diseased green shoots down the older portions of the tree.

The progress of the disease from the point of inoculation was always slow, never giving external, visible signs of its presence under eight days, and rarely extending after this more than half an inch per day. In some cases the leaves remained green three weeks after the bark of the shoot bearing them was thoroughly diseased. In other cases the bark of larger limbs was quite dead, yet the leaves, borne some distance above, remained green all

Fig. 1.—PORTION OF DISEASED BARK.

summer. This slow progress of the disease shows that the destroying agents are not carried in the circulation of water or sap in the tree, as, indeed, the teachings of vegetable physiology would also indicate. The Bacteria—shown in fig. 2, magnified 2,000 times—in some way not yet explained, pass from cell to cell. Figure 1, shows a thin section of the diseased bark from a pear tree, with the Bacteria in the cells, magnified 500 times.

Having recently received portions of peach trees affected with "yellows" from Michigan, I find plain indications of the similarity of this disease to that of the pear. The Bacterium is evidently specifically different, but operates in the same way, causing fermentation of the starch. The Lombardy Poplar is also destroyed in a similar way, but in this case the Bacteria follow wounds of insects.

It is too early to propose, with much assurance,

Fig. 2.—BACTERIA SEPARATED.

remedial measures, but the slow progression of the disease in the tissues gives reason for hope. Antiseptic washes may be sufficient to prevent or cure. Pruning or paring away the infected parts, taking due precautions not to spread the contagion by the process, certainly is effective, and by studying the earliest symptoms of the malady, the cutting may usually be very moderate.

**Cherries Once More.**—During the past 20 years or so cherries have been very scarce, instead of being as they formerly were so abundant in their season that in many places they could be had for the picking. The present year has shown something like the former abundance, and those who had not cut down their trees in despair were rewarded for many years of failure. Whether the weather at blossoming time was especially favorable, whether the natural enemies of the curculio have essentially diminished its numbers, or both causes combined, the result has been most gratifying. In the city one could buy a basket at a reasonable rate, and the licensed vendors offered fine fruit at 5 cts. for what they are pleased to call a pound. Our experience this year allows us to understand the great popularity of the "Early Richmond," with the western fruit growers. Our one tree, which in former years bore better than any other, was this year an example of fruitfulness, wonderful to behold; looking up into the tree one saw a canopy of fruit, the leaves being in the minority. This, by the way, is a most valuable fruit for cooking or canning, and when allowed to get dead ripe, is not to be despaired to eat "out of

hand," as its acidity ripens into richness. If this fruitfulness is to continue, we shall be encouraged to plant cherry trees in abundance once more.

### Notes from the Pines.

"The Pines," in view of which the present "Notes" are written, are not those of New Jersey, but of Old Jersey. The Island of Jersey is not quite as large as its newer name-sake—as it is but eleven miles long by half that in width. The Island is best known to Americans as the home of the Jersey Cattle (which many persist in mis-calling "Alderney,") and to Englishmen, in general, as the source of their early potatoes and some of their best fruits. As Paris is France, so is St. Heliers, Jersey, it being the port and business center, with streets crooked enough to gladden the heart of a Bostonian, and side-walks so narrow that the people walk in the road-way as much as on the walks along the sides. Soon after arriving, I visited

#### The Market of St. Heliers.

Were this the proper place in which to do so, I should try to describe this curious museum of things brought for sale by "The Toilers of the Sea."—I think that Cod was the only thing I recognized. There were eels as large as one's leg, crabs a foot across, and several other sorts of less dimensions; lobsters with spines on them, besides limpets, winkles, and other things that we do not have, and probably should not eat if we did.

#### The Vegetable and Fruit Market

was very full. The vegetables were scarcely different from those in the London Market, but the fruits finer and much more abundant. Excellent apples, and pears, were in great plenty. The pear "Louise Bonne de Jersey," though not so well colored, is much better flavored than with us. Figs (fresh) very large and luscious, were cheap, to those who are fond of them; these ripen in the open air, and the trees are quite common all over the island; grapes, on the other hand, need glass, and there are some immense vineries, much of the fruit from which goes to London. I bought such Black Hamburgs for a shilling (24 cents) a pound, as we rarely see in our fruit stores for \$1 per lb. Blackberries grow wild in plenty, and just now illustrate the old adage that "blackberries are always red when they are green."—The few ripe ones were very small, consisting of but few grains, badly shaped, and quite inferior in flavor to any of our wild kinds. Our delicious cultivated sorts do not appear to be known here or in England. It is doubtful if there is enough heat to bring them to their full perfection, but I think they should be tried.

#### Farming and Jersey Cattle.

The cattle, at least, do not come under the head of horticulture, and it is likely that something may be said at a future time on both these topics by my associate, as occasion offers. The farming is mostly, in fact, market gardening on a large scale. Any farmer, when asked what is his principal crop, replies "potatoes." For several years this has been the "money crop" of the Island, and it is cultivated by manuring quite as highly as do our market gardeners for their crops.

#### The Treatment of Seed Potatoes

is quite peculiar, and might perhaps be tried by some of our growers of early potatoes, especially in those Southern States where the crop is an important one. Already the "seed" is being prepared for next spring, and we see them everywhere in large quantities. Potatoes of medium size are selected and placed in boxes, usually made for the purpose, though other boxes are some times employed. We saw at several places in the town the boxes, or rather skeleton crates, exposed for sale, I think, at a penny each, but am not sure of the price. A rough sketch will allow the artist to represent it. It will be seen that it is a shallow box, 24 inches long, and 12 inches wide, with sides 2 inches high; it is of about  $\frac{1}{2}$ -inch stuff, the bottom being of three slats of similar material, with nearly  $\frac{1}{2}$ -inch spaces between them. In each corner of this box is a post 7 inches high and  $\frac{1}{2}$ -in. square; a strip connects the posts at the ends, and across the top runs a lengthwise strip one inch wide by  $\frac{1}{2}$

thick; this is let into the end pieces so that it is flush at the top. The potatoes are set "seed-end" up in these boxes as closely as they can be packed, taking care to put those of a size together. At first the boxes, when filled, are put in any convenient place in the open air, fully exposed to sun-light, in order that they may become thoroughly greened. As cooler weather comes on, they are taken into the house, and stacked up in some suitable place. The peculiar form of the boxes allows of putting one

A CRATE FOR SPROUTING POTATOES.

upon another—as many as may be desirable—and still have sufficient ventilation and exposure to light. By the time the weather will allow of their being planted, strong sprouts about two inches long will have grown. The planting is done by setting the potatoes upright in the furrow in the same position they had in the box; great care is exercised in handling while planting, in order not to break the sprouts. As the planting may be delayed until all danger of frost is over, the potato, when placed in the soil, is ready to go on and grow at once.

#### Much is Gained by this Method.

In planting in the ordinary way, the potato remains for a long time in the soil before the vegetative process begins, while by this method all the preparatory work is done in advance, and growth, having already begun, is at once continued. I hope that some of our growers will try this Jersey method and report the results. I am aware that cutting the potato some weeks in advance of planting, and placing them in a warm room to "sprout" is not new with us, but the method here described, beginning in the fall, and inducing a slow and sturdy growth of sprouts is somewhat different, and seems to me to have some advantage over that manner of preparing the "seed," and is worthy of a trial.

#### The Yield of Potatoes per Acre,

under the method practised in Jersey, is very difficult to ascertain, as their measure of land (*vergee*) and their measure for potatoes (*cabot*) are quite unlike ours, and besides, they estimate the yield per vergee in the £. s. d. it returns, rather than by the measure of potatoes it gives. A rough calculation shows that their potato crop returns from £40 to £90 per our acre, which is not far from \$195 to \$435 per acre; in some cases the returns have been as high as £120 per acre, or about \$580. Though considerable sums are laid out for guano and other fertilizers, these are not all chargeable to the potato crop, as a second crop, usually turnips, is taken the same year, and in their rotation a crop of wheat is followed by clover, and all these are benefited by the heavy manuring given the potatoes.

#### Sea-Weed, or "Vraic,"

is largely used as a manure, both spread at once on the land, and put up in heaps to form compost. While the drift sea-weed can be collected at any time, the gathering of that which is attached to the rocks is regulated by law, or custom, but, I think, by law. I much regretted being a few weeks too late for the "Vraic" harvest, which is said to be a festival of peculiar interest upon the Island.

#### Orchards are Numerous,

but the trees are generally in bad condition, the moist atmosphere encourages the growth of those obscure vegetable forms to which our orchardists give the collective name of "Moss." Here the bark of the smallest twigs is covered with a greenish growth, which must essentially affect the health of the trees. Besides, the orchards are almost without exception in grass, and used as pastures for cows. When the cows are pastured they are rigged with a curious halter of rope and two pieces of curved wood; a part of this affair, which cannot well be described, goes over the head, and a rope from each side of it is tied around the fore-legs of the animal, the object being to prevent

browsing on the trees. While the cows, with this halter, can graze easily, they can not lift their heads.

#### Private Gardens

are often very fine, and there is scarcely a farmhouse, however unpretending, but has a small piece of ground in front, tastefully planted and well kept. The English exclusiveness in such matters prevails here to a great extent. The fine places are generally surrounded by a wall, often 8 or 10 feet high, and only a glimpse of what is within is had through the open gate. Pastures, now the last days of September, are as fine as they are with us at any time. It will be supposed that the lawns are in correspondingly good condition. More perfect lawns cannot be imagined anywhere. A favorite tree for planting on lawns is the

#### Araucaria Imbricata, or "Monkey Puzzler,"

a most formal tree, not hardy with us, but which grows here in great perfection. We plant Sweet Peas, and the July heats finish them. Here in Jersey, they are still in abundant bloom, often growing to a great height. Perhaps these, more than anything else, most forcibly impressed upon me the great difference between Old and New Jersey. This difference is further illustrated by roses in full bloom. The Lemon Verbena (*Lippia citriodora*) here forms a tall, hardy bush. Camellias are hardy in the open air; I saw one that had not failed to bloom abundantly for 20 years. There are many other things which show how mild a climate this Island enjoys—among them the Laurestinus, which, with us, even a mild winter would kill, is seen here everywhere just coming into flower; in one case I saw two bushes 10 or 12 feet high, trained to form an arch over a gate-way. Here and there we are reminded of home by some American plants. In several gardens I have seen large clumps of our

#### Cardinal Flower,

*Lobelia cardinalis*, forming a mass of scarlet such as few plants can equal. It may be that the fact that our common things are thus appreciated abroad may induce some of our nurserymen to turn their attention to the growth of our native plants. One sees on every farm a larger or smaller patch of

#### The Jersey Cabbage.

Several years ago our seedsmen offered the seeds of this as "Jersey Cow-kale," and from this I inferred that it was used in Jersey as feed for the cows. The fact is that it is never fed to cows, but is grown especially as food for pigs. It is a Kale rather than a Cabbage, as it never heads. It naturally has a tall stalk, but as the lower leaves are picked off for the pigs, the stalk goes on increasing in length, and it is not unusual to see them 6 and 8 feet in height. The stalks, when ripe and seasoned, make excellent walking-sticks, being both strong and light. In St. Heliers, there are several shops with signs showing that the owner is a

#### "Manufacturer of Cabbage Canes."

Mounted with a ferrule, and varnished, they are one of the specialties of the Island, and few strangers visit here without carrying off one or more "Jersey Cabbage Sticks." In some cases they are mounted with silver heads. Another reason for growing this Cabbage, is for its supply of leaves in which to pack butter. The neat pats of Jersey butter—and how delicious is Jersey butter at home!—are always sent to market upon a leaf of this gigantic Kale. It is with regret that we leave this charming Island. In conclusion, I would advise every one who visits Europe to make a visit to Jersey. I know of no other place, at home or abroad, that combines so many attractions for those who would see rural life in its highest development.

**The Farmer's Garden.**—The common idea among farmers, that manure and labor spent on the garden is nearly thrown away, is absurd. The cultivated field pays just as we invest labor and manure upon it. The garden, with more thorough cultivation, and a greater variety of crops, pays still better. It brings its offering to the table, in some shape, every day in the year. As the frost comes out of the ground in the early spring, it yields horse radish, artichokes, and parsnips. With the first genial days of April and May, it gives you pie-plant and asparagus, etc., etc.

## THE HOUSEHOLD.

For other Household Items see "Basket" pages.

### A Shell Catch-All.

Not long ago we saw a man on Broadway selling sea shells of various kinds, many of which were

A CONVENIENT CATCH-ALL.

arranged to serve some useful purpose, and at the same time possessed considerable beauty. One of these was a Catch-all, shown in the accompanying engraving, which has been made from a sample purchased for ten cents. The shell has a "setting," apparently in the end of a birch log, but it is not so. A piece of thin pine makes the bottom, which is of the size and general shape of the outline of the shell. Another thin piece of wood is then wound around this bottom and the edge of the shell, and fastened in place by glue, and covered with a strip of birch bark. The irregularities of the rim are filled in with some fine cement and given a coat of varnish, when the shell is "set," and the dish is complete. Such a mounted shell is quite handsome, and is so cheaply and easily made that it is within the reach of any one. It may be used for receiving burnt matches, and as the lining of the box is not combustible it is perfectly safe. Should there be a person in the house who smokes, he will find this Shell Catch-all convenient for receiving the ashes of his cigar, etc.

### A Linen Wall-Pocket.

The convenient Wall-Pocket shown in the accompanying engraving is made of pasteboard, well-starched gray linen; a braid of any desired color,

Fig. 1.—A LINEN WALL-POCKET.

and embroidery work to suit the taste. The pattern is made in this wise: Make a square on a large piece of paper, so that one half of it will be the

size desired for the upper part of the back of the holder or pocket. Draw diagonal lines from opposite corners, prolonging the perpendicular one half its length beyond the lower corner; connect this end with the ends of the other diagonal, and the outline of the pattern, as shown in figure 2, is complete. Cut the pasteboard after this pattern, and cover with the linen and braid, and stitch as one may desire; in fact, the limit to this decorative needle-work depends upon the taste, patience, and ingenuity of the designer. The cover should be so made that it can be removed from the pasteboard when it requires to be washed. The front part is made of the linen folded as in making a newspaper fan, through the upper part of the folds of which a cord is passed, and fastened to the pasteboard back at the sides. The bottom and sides should be firmly fastened to the back, and the wall-pocket is ready to be hung up by a ribbon fastened with a bow, as shown in figure 1. With these general directions, any one may make a wall-pocket that will be both ornamental and useful.

Fig. 2.

## Home Topics.

BY FAITH ROCHESTER.

### Hard Water and Soft Water in Cooking.

I have been reading the testimony of Alexis Soyer, the celebrated *chef de cuisine*, concerning the effects of hard and soft water upon food cooked with either. He gives the preference in all respects to soft water, unless in the one matter of cooking fresh meat with a view to making it as white as possible. He says that hard water seems to contract the pores, and solidify the gluten, so that he believed it to be impossible to extract the true flavor of meat with hard water. In boiling salt meat, soft water extracts more salt than hard water, and makes the meat more tender. Soft water evaporates one-third more rapidly in boiling, and cooks every thing in less time. He said that hard water shrivels greens and peas, and affects leaves more than roots. Potatoes boiled in hard water are harder and whiter than those boiled in soft water, and more time is required for the process. In cooking dry vegetables, he says, we must allow one-fourth more time for hard water. He had no doubt that soft water makes the best bread. He said that bread made with the same flour and the same yeast, and by the same bakers, is much inferior made with hard water than when soft water is employed. He made many experiments with tea, and decided that soft water draws out the flavor of the tea more fully and more rapidly than hard, so that for a "good cup" one must take more tea when using hard water than when using soft.

### Washing Done Out of the House.

I am obliged to hire my washing done now, and am glad to have it taken out of the house, and returned to me, unironed. My washing is so large that a woman washing in the house, calls it a day's work, and charges accordingly. She may do some cleaning up, but taking the spatters on the wall, and the muss she makes while washing, and the extra labor of boarding and waiting upon her, into account, I think the work she does beyond the actual washing is not more than the trouble she makes me. My floor, being painted, I do not wish her to scrub it, and am able to wash it myself. It seems good to have the work all done out of my sight, the clothes not only hung out to dry, but safely basketed, whatever the weather. I pay no more money in the latter case than in the former, and in both cases furnish soap and starch.

### Starching Made Easy.

My washerwoman objects to making two kinds of starch, and prefers to starch all of the clothes with fine laundry starch. Finding that she used half a package of "silver gloss" starch in the first washing, where she only had two shirts and two skirts with a few collars, but three dark calico dresses, and several large aprons and baby dresses and aprons, I proposed to her to make only flour

starch and use that for the calicoes, etc., and I would starch the white clothes. She is unwilling to do so, because it takes so much time to make flour starch, or to rub out the lumps of flour to perfect smoothness. My sympathies are with her, and I yield the point, mentally, resolving to buy starch by the large, or wooden, box, and to provide large dark gingham aprons for the children, and to give up calico dresses until spring, so that the number of pieces will be diminished. I never feel that I can stop to make flour starch when I do my own large washings, and unless I can get the starch made by another person, I make enough fine starch for all the pieces that need stiffening, or omit altogether to starch some of the oldest every day clothes. To be sure the laundry starch costs a trifle more, but dear me! Time is money, and health too, and good temper and home happiness besides.

I think it the best way to stir the starch, sufficiently moistened, into the boiling water, instead of the more common way of pouring boiling water into the moistened starch "stirring briskly to prevent burning." I now make both flour starch and laundry starch in this same way. There is less liability of burning and more certainty of having the whole equally and well boiled. To the fine starch, when boiled, I now add a little starch gelatine, as it makes the starch less liable to stick, and easier to take a gloss in ironing. There are other preparations equally good I presume. But the latest and simplest thing I have heard of, in the way of starch, is *skimmed milk*! I am assured by a friend that she has often tried it, when she had only a few calico pieces in her washing. Dip the article into sweet well-skimmed milk, and it will dry as stiff (a little stiffer I should think) as common flour starch would make it. If there is cream in the milk it will grease it, of course.

### Baby's Diapers.

It has been my custom to make outside dlapers of large squares of unbleached cloth, fold double squares of old cotton inside those. This puts the thickness where it needs to be, and relieves the hips of too warm a burden. To-day I saw, in a friend's house, large half squares of cotton flannel for the outside use with long "towels" of the same material to fold inside. If I had another supply to make for a child large enough to run alone, I should make such half squares of cotton flannel if for winter, and of strong cotton cloth for summer. Then I would lay four small plaits, two on each side, a few inches of the hypotenuse of the triangle, or about four inches apart. I would stitch these down an inch, folded straight toward the right angle of the triangle (you understand this geometry, I trust), and so make a kind of band to the diaper, over the hips and behind. I fancy this would make the garment stay on better, without too great tightness, and that it would be more comfortable for the child. It is somewhat like the diaper drawers, but keeps its necessary character by fastening snugly with the safety pin or pins.

### Under Suits for the Smallest Toddlers.

For children who still wear diapers, I know of nothing better, except perhaps the nice (and expensive) long-sleeved, long-bodied, high-necked knit shirt, than those long-sleeved rather loose, soft flannel waists, reaching over the bowels to the diaper. These button behind and have several buttons around the bottoms, to which may be buttoned open underdrawers or warm flannel panties. I used to make little breeches running up to a point at the top, out of the way of the diaper, and fastened to the skirt waist on each side, by one button. That is a good way, but now it seems to me, that those I must make immediately, will be wide enough at their very tops to button clear around the waist, meeting in the front and back, but still separate, so that one can be removed if necessary, without disturbing the other. I have a mind to make these inner leggings of old, white, ribbed merino stockings, or the better part of merino underwear, snug enough at the bottom to go inside the stockings, reaching to the ankle-bone, and held in place by a strap under the foot. The baby will not be too warm in winter weather with these and my old-fashioned colored flannel knee breeches too. The

latter come only over the knees, fulling a little at the bottom. In speaking of old merino stockings and underwear, I most certainly do not mean that which is fulling up, "thick as a board." There is no necessity for reducing soft flannel to this condition, and as few people know how to avoid it, I may tell them once more in a later paper.

### Animals in Needle-Work.

The accompanying engravings illustrate how some of our domestic animals may be brought out with the needle and thread upon articles

Fig. 1.—A CAT FOR A PATTERN.

of clothing, beddings, mats, etc. The sizes of the squares and that of the thread will vary according to the nature of the work, but the character of the stitches and the relation of the parts will remain the same for each particular animal. A cat or "rooster" on a tidy will not be as large, of course, as upon a floor mat or blanket. The patterns here presented are of but two of the many familiar animals that may be thus developed with the needle

Fig. 2.—A ROOSTER IN NEEDLE-WORK.

and thread. Others will suggest themselves, and give an opportunity for the exercise of a considerable ingenuity on the part of the designer.

### Notes and Queries.

**TREATMENT OF COLDS AND CROUP.**—We believe in "every one to his trade," and in all cases of severe illness or accident call in the skill of one who makes a business of studying the human system and its disorders. Yet many, especially in frontier settlements, find it impracticable, if not impossible, to always obtain reliable medical advice. We offer a few hints, that may be serviceable in ordinary, slight troubles—Colds, taken in hand promptly, are easily remedied. If they are allowed to cling to one for a few days, they usually "run their course" of a couple of weeks if not much longer. For a slight cold accompanied with sore throat, a simple remedy, often effective, is a teaspoonful or more of powdered Chlorate of Potassa, in a tumble of water—all that will dissolve. A teaspoonful of the solution is to be gargled in the throat and swallowed—repeating it every hour or so. A sudden, severe cold is most often broken by a gentle physic of Calined Magnesia or Castor Oil, with warm foot bath, and avoiding any chill or draft of air for a day or two. For filling up of the lungs and much gathering or coughing we use a simple cough syrup, made by mixing equal quantities of Syrup of Ipecac, Paregoric, and Castor Oil or Sweet Oil; shake well, and take from half to a full teaspoonful, according to age, three or more times a day as needed. A warm sweat is good, if great care be taken to have no chilly feeling for a few hours after. If one does not cool off *very gradually*, more cold will be taken. Croup is, in some families, much dreaded. Its guttural cough is unmistakable after having once heard it. When first

noticed we administer Syrup of Ipecac—10 drops to an infant, up to 20 drops to a large child—every hour or so until vomiting is produced. Then use the above cough syrup three times a day or more if needed. If more than a slight attack the Syrup of Ipecac is accompanied with foot baths as warm as can be borne, with a tablespoonful of good Mustard stirred into each gallon of water. In addition, the chest and neck are well bathed with Camphorated Oil or Volatile Liniment, and covered with flannel lined with thick cotton hating. It is well where croup is feared, to keep ready for use a flannel cut to fit the chest and neck, with tying strings on the neck corners, and with thick cotton batting stitched on to the under side. These remedies have proved effective in most cases of ordinary croup. If at all severe and not yielding immediately to the above simple home treatment, a physician is called in.

**CREOSOTE FOR BRONCHITIS AND CATARRH.**—When going from Switzerland to Italy via Mont Cenis, some years ago, the writer contracted a sudden severe cold, which, in the chill air of Turin, soon brought on a severe attack of Bronchitis. We hastened over to the genial air of Genoa, but it afforded little relief, and the advice of Dr. Paccioci, Professor in the noted Italian Medical College there, was called in. He prescribed a very simple remedy, which was at once effective, as it has been with many others to whom we have since recommended it. Put into a pint or larger bottle about three gills of water, and add two drops of good Wood Creosote. Shake very thoroughly, take a mouthful, gargling it awhile in the throat, and swallow it. Repeat this frequently, so as to use up the mixture in the first 24 hours, always shaking well before taking. After the first day, use three drops of Creosote and the same amount of water during 24 hours, so long as it is needed.—The same mixture has often proved very useful in Catarrh. In this case a handful or two of the well-shaken Creosote and water is snuffed up through the nostrils until it reaches the throat and is spit out. A tablespoonful or more is also gargled in the throat and swallowed. As Catarrh is an inflammation of the nasal passages, accompanied with a mucus deposit, the creosote, which is largely carbolic acid, would seem to be useful here just as dilute carbolic acid is effective in cleansing any putrid sores. Catarrh is the result of weakness, and is promoted by a cold. A toning up of the system and any simple remedy like the above is effective, unless the Catarrh is severe and of so long continuance as to have permanently disorganized the nasal cavities. It is folly to spend money for the much vaunted and much advertised catarrh remedies, which are usually the sheerest medical quackery.

**PLANTS IN POTS.**—As the cold weather comes on, and the choicest plants are being taken in, let it be remembered that you are limiting the "feeding ground" of the roots, and therefore the potting earth should be rich. Newly-potted plants require much water, especially if they are taken into a room where the temperature is moderately high. Besides food and drink, plants require sunlight and air. With proper care—and it is not great when done at the right time—a fine collection of plants can be kept through the winter and be a source of delight, with their fragrant flowers, in contrast with the apparently lifeless vegetation out-of-doors.

**A "HORSE SHOE" PICTURE FRAME.**—The horse shoe with its "Good Luck" is now a familiar sight in many articles of household ornament. The picture frame, shown in the accompanying engraving, is sketched from one we saw at a recent fair. It was made from a thin strip of holly with a scroll saw. The frame may be made of any desired size—the one in question being for an ordinary photograph. A mantle ornament of this kind, with variations in detail of cutting to suit the taste, can be made by any one with a scroll saw and a little skill.

HORSE SHOE PICTURE FRAME.

### A Handy Folding Table.

Mr. James H. Ten Eyck, Auburn, N. Y., sends a model of a Folding Table, from which the accompanying engravings have been made. Concerning the table, Mr. Ten Eyck writes: "It may be made of any desired size, but for the purposes for which it is most generally used, namely, for ladies' work,

Fig. 1.—SHOWING UNDERSIDE OF TABLE.

sewing, as a writing, or invalid table, a very convenient size for the top is two by three and a half feet, and two feet two inches high. Black walnut, ash, and chestnut, are the most suitable kinds of wood. The top should be about five-eighths inch thick, with bevel or rounded edges; the legs, one by one-and-three-fourths inches, rounded edges; the strips or wings at top of legs, one-half by three inches, and three feet two inches long. The round between the intersection of the

Fig. 2.—TABLE IN POSITION FOR USE.

legs is about an inch in diameter. The wings should be hinged to the top, two and one-half inches from the outside edges, and let into the edges of the legs—flush. The spread of the legs on the floor should be about twenty-two inches for a table two-feet wide. Iron or leather washers may be placed between the legs where they cross, to prevent their touching in folding. In cutting the rod, or "round," see that it is long enough to crowd the legs apart so that they will stand a little bracing. This will stiffen the table and make it stand firmly on the floor. This point is quite important, and it does

Fig. 3.—THE TABLE FOLDED.

not interfere with the folding in the least. To fold the table, simply lift it by the ends. To carry, or move it without folding, lift it by the sides. When folded, it is of a convenient height to carry, and occupies only four or five inches against the side of the room, and is consequently easily set aside, when it is not in use, in an out-of-the-way place."

## BOYS &amp; GIRLS' COLUMNS.

## The Doctor's Talks.

It will be remembered that last month the relation between the sun, rainfall, and the flow of water in streams and rivers was pointed out. It was also said that there were two general kinds or classes of water wheels to make use of the power in moving water; the *vertical* wheels that turn "over and over," and the *horizontal* ones, that go "round and round." The three principal forms of *vertical* wheels, namely: the over-shot, under-shot, and breast wheels, were described and illustrated, and the *horizontal* ones were left until another time. The working of the horizontal, or Turbine wheels, is fre-

Fig. 1.—APPARATUS KNOWN AS "BARKER'S MILL."

quently explained to classes in Natural Philosophy with an apparatus like that shown in figure 1. This machine consists of a vertical tube, C, connecting with two horizontal arms which have their ends bent as shown in the one drawn separate at A, B. The upper part of the tube is enlarged so as to receive water from a can above it, provided with a faucet. The tube, with its arms, rests upon a pivot in the bottom of the dish, and the whole can move freely. It will be observed that the four ends of the arms are all bent in the same direction, though at first sight it may not seem so. As the water flows through these bent tubes, and out the opening at the ends, the whole apparatus on the pivot is made to revolve, and in a direction opposite to the water jets, as shown by the arrow in the illustration. But what makes the flowing of the water turn the machine? It is because the tubes are bent, and all bent in the same direction; if they were straight, or two bent one way and the other two bent equally in the opposite direction there would be no motion. In a bent tube there is a unequal pressure of the water upon the sides as it flows through, the liquid tending to straighten the tube, but in the case of a thick tube

of glass, iron, etc., this cannot be done, and, if possible, the whole tube will move, as in the case of the "mill," shown in figure 1. This unequal pressure of water flowing through a curved tube may be clearly illustrated in the case of a rubber hose; if the water is let in quickly, the curved end of the tube will be

Fig. 2.—A TURBINE WHEEL.

thrown wildly about. Firemen have to be on their guard to have the water-hose as straight as possible when they are throwing a heavy stream with great force. A Turbine water wheel is shown in figure 2, but it is so compact that it will be hard for some to get a clear

idea of its structure without another figure showing its arrangement inside, which is done in figure 3, giving a section of the wheel. The wheel is driven by water which comes from above, entering the wheel through the side openings or shutes (D, fig. 3), and strikes against the "buckets" marked B, the arrows showing the direction of the flowing water. The "dead water" escapes from the central part of the wheel, at the bottom of the flume. The motion of the wheel, which is under water, is given to the machinery of the mill or factory through a shaft marked A, in figures 2 and 3. The turbine wheels are not all made to work in exactly the same way as the one here shown, but they are all horizontal, and are the most effective water wheels yet known, that is, they give the most power to the machinery of the mill for the force that is in the water that flows through them.

Fig. 3.—SECTION OF TURBINE WHEEL.

## Solution: What Is It?

Here comes a hard question from a boy, that does not live a thousand miles from a large and rapidly growing city near the lower end of Lake Michigan. He wants us to tell him what we mean by SOLUTION. It is to be presumed that the young questioner has looked the word up in the dictionary—all should do this before writing to us—and found that it comes from the Latin *solutio*—to loosen. The word *Solution*, as it is now used, has a number of meanings—as the solution of a problem, etc. It is evidently the solution of a substance, as that of sugar or salt, that the young friend has in mind. If we take a glass of pure water, and stir into it a tablespoonful of white sugar, the sugar soon disappears, and to the eye is entirely lost. If we had weighed the water and the sugar before they had been put together, and the (here we have to use our word) *Solution* made by mixing them, no loss of weight would have been found. The sugar has dissolved in the water, and a *Solution* been formed which is sweet to the taste, and may be called a syrup. But

why does the sugar dissolve in the water? There is a force called Cohesion, which you have had explained in a Doctor's Talk not many months ago, that acts between like particles of matter, and tends to hold them together. It was Cohesion that held the particles of sugar together to make the lump of sugar. There is another force called Adhesion, which acts between unlike particles, and tends to hold them together. Now, there is the adhesion between the particles of water and the particles of sugar, and that force is so strong that it overpowers the cohesive force of the particles of sugar for each other, and the particles of water for each other also, and the sugar and the water unite, it all becoming liquid; or, in other words, the sugar melts away in the water. This melting will go on as we add more sugar until a time comes when no more will dissolve, and then we say the solution is a saturated one—the water having received all the sugar it can hold. There are many substances that are not soluble in water, and therefore when they are put in water none of their substance disappears. If wood was soluble in water, a common boat would not last long, when pushed into the lake. The reader will think of iron, quartz, and many other solids that are not soluble in water, and also some liquids that do not dissolve in water, as quicksilver, etc.

## Our Puzzle-Box.

## CROSS-WORD.

My first is in brilliant but not in gay,  
My next is in morning but not in day,  
My third is in shutter but not in blind,  
My fourth is in conscience but not in mind,  
My fifth is in wisdom but not in sense,  
My sixth is in pining but not in fence,  
My seventh is in carpet but not in rug,  
My eighth is in tumbler but not in mug,  
My ninth is in barter but not in sell,  
My tenth is in mountain but not in well,  
My eleventh is in country but not in town,  
My twelfth is in feather but not in down:  
Dear reader prithee shun my whole,  
It damages the very soul.

## NUMERICAL ENIGMAS.

1. I am composed of 22 letters.  
My 6, 7, 4, 19, 22, is part of a cask.  
My 16, 1, 9, 8, 2, 7, is to become invisible.  
My 12, 11, 10, 3, 13, 21, is part of a child's clothing in winter.  
My 14, 15, 5, 20, 9, is a fabric.  
My 18, 17, 16, 13, 19, is a number.  
My whole is an excellent proverb.
2. I am composed of 19 letters:  
My 14, 8, 7, 17, is an insect.  
My 3, 17, 19, 2, 5, 11, is a hard, brittle metal.  
My 1, 18, 12, 4, is steam.  
My 9, 10, 12, 6, 16, comes from the clouds.  
My 9, 13, 15, 7, is any particular place.  
My whole is the title of a song.

## LOGOGRIPH.

Find a word of four letters, from which you may find words to fill the blanks in the following history:  
We were sitting \_\_\_\_\_ one day; there was plenty to \_\_\_\_\_, but I \_\_\_\_\_ nothing, for I had a pain in my \_\_\_\_\_, and a \_\_\_\_\_ in my eye. I could not help laughing, however, when I saw the cat run through the room at a furious \_\_\_\_\_ after a \_\_\_\_\_.

## PROVERB ENIGMA.

This puzzle represents a well known proverb, exemplified in the central picture. The several objects dis-

played around this may be described by words composed of those letters in the proverb which are designated by the numbers near each object.

## DOUBLE ACROSTIC.

Two opposite emotions  
Initials and final are,  
The first is horn in Heaven,  
Last never enters there.

1. An instrument of torture.
2. Here music gives delight.
3. A sweet and fragrant flower.
4. Most welcome, day or night.

## CHANGED HEADS.

First I am a period of time; change my head several times, and make (1) an unpleasant sensation, (2) beloved, (3) to raise, (4) dry, (5) a fruit, (6) an animal, (7) apparatus, (8) to lacerate, (9) to be told, (10), one of Shakespeare's characters, (11) to waste, and (12) immediate.

## PUZZLE

Take a third of twelve,  
And a third of one,  
And you'll only have two  
When the whole is done.

## ANAGRAMS.

1. Fool's crime.
2. Brighten any.
3. O! I bit Missie's lip.
4. Foul singer.
5. Tea-urn fount.
6. But a last sin.
7. Ice funnels.
8. Dire ration.
9. For tin pieces.
10. Light may cool.

## CONCEALED FISH.

1. Read me that psalm once more, Phebe.
2. Come to supper, Charlotte, the bell has rung.
3. I have just arranged the chairs.
4. Here comes Rudolph, in search of his father.
5. Charles had the measles.
6. The key is under the step; I keep the door locked.
7. Indeed we were not routed; we retired in good order.
8. Hush, Rufus! Hark! Here comes the circus.

## A SQUARE AND CIRCLE PUZZLE.

Take a piece of paste-board, and cut it into the shape shown in the accompanying diagram, and prick in it twelve circles in the positions indicated. The puzzle is to cut the board into four pieces of equal size, each piece to be like all the others, and therefore to contain three of the circles, without cutting into any of them.

## DEFINITION PUZZLE.

(In each sentence may be found the necessary letters to spell the word defined. *Example: Organ of smell—Nose.*)

1. To support.
2. The Superior of a monastery.
3. To call to witness, to beseech.
4. A solemn or blasphemous affirmation.
5. A pinch, a blast.
6. A notch, a score for keeping an account.

## CONCEALED ARTICLES OF CLOTHING.

1. I love illustrious men.
2. What a darling love of a bonnet!
3. That is a beautiful dress.
4. The fabric appears to be Chinese.
5. Did you get it at the Oriental booth?
6. This cocoa tastes delicious.
7. Tommy wants his hoe, Father.
8. I wish those dogs would stop barking.
9. Robert loves those horrid things!

## BLANK RHYMES.

(Fill the first blank with a certain word, and let all the words for the rest of the blanks rhyme with it; making sense of the whole twelve lines.)

I went to the city to buy some—,  
 'Twas winter, I had many a—;  
 One time I fell upon my—,  
 And on a stone I cut my—;  
 I gave my coat a cruel—,  
 With me I took my puppy—,  
 Who ran along with many a—,  
 And in my hand I held a—,  
 In summer, once, I took a—,  
 To Coney Island, to get a—,  
 In ocean-wave; there saw a—;  
 Of lemonade I took a—.

## ANSWERS TO PUZZLES IN THE OCTOBER NUMBER.

CONCEALED FABRICS.—1. Gingham. 2. Merino. 3. Cotton. 4. Linen. 5. Silk. 6. Satin. 7. Muslin. 8. Serge. 9. Calico.

NUMERICAL ENIGMA.—Mustard.

CROSS-WORD.—Be cheerful.

DEFINITION PUZZLES.—1. Rowel. 2. Vital. 3. Use. 4. Tussle. 5. Rowen. 6. Virulent. 7. Chapel.

SQUARE WORD.—

LOVER  
 OBESSE  
 VESTA  
 ESTOP  
 REAPS

CHARADE.—Massacre.

WORD-MAKING.—1. Phial+  
 C, transposed=Caliph. 2.  
 Lyre-beryl. 3. Greed-ledger.  
 4. Servant-veterans.

DOUBLE ACROSTIC.—Cam-

modia, elephant.  
 C-hid-E  
 A-ctua-L  
 M-ous-E  
 B-um-P  
 O-H  
 D-ace-A  
 L-ro-N  
 A-trac-T

PI.—Have courage enough

to review your own conduct,  
 to condemn it where you de-  
 tect faults, to amend it to the  
 best of your ability; to make  
 good resolves for future  
 guidance, and to keep them.  
 CONUNDRUM.—The letter  
 C, because with it a *lad* might  
 be *clad*.

## The Coming Year.

There are a number of curious things with regard to the figures and their relations in the year 1881. From right to left and from left to right it reads the same. This will not happen again for a long time to come—just how long we will leave for the reader to determine. The first two figures of 1881, divided by 2, gives 9, and the last two figures, divided by 9, gives 9 also. If the figures of the year be divided by 9, the quotient will contain a 9, and if multiplied by 9, the product will contain two 9's. If the first two figures be added together, the product is 9, and if the last two figures be added, the sum is 9 also. If the first two figures be placed under the last two, and added, the sum will be 99, and 18 is  $\frac{2}{9}$  of 81. By adding, dividing, and multiplying, nineteen 9's are produced, or one 9 for each year required to complete the 19th century. The year that is before us is certainly peculiar in a figurative sense. What else this coming year, that will soon be upon us, may bring can be better told upon the morning of Jan. 1, 1882, when it will give place to its successor.

## A Strange Flower Bed.

Last month I showed the method which a strange old man had of setting 27 trees so that they would be in ten rows of six in each row. In the accompanying diagram, there is shown the plan of a flower bed,

PLAN OF FLOWER BED.

in which the plants are so arranged that 18 varieties are in one circle; seven circles, with six varieties in each; six straight rows, with six kinds in a row, and three straight rows, with five plants in a row. All these plants: in large circle (18) plus, seven times six (42) plus, six times six (36) plus, three times five (15) gives a total of 111. Only 31 kinds of plants and only one of a kind are used. Small plants will be required in a few of the places in the outer row. The dotted lines show the various circles and straight lines that are produced by this method of planting a flower bed. Any boy could, with a little pains, plant the bed of 31 plants in this shape if he so desired. The circles could be made with a piece of twine and a stake, and the points where the lines cross would be the places in which to set the plants.

U. H.

## The Kangaroo.

One of the strangest of animals in Australia—where everything is said to be peculiar in both animal and plant life—is the Kangaroo. There are a number of different kinds of Kangaroos, one of which is a tree climber, and jumps from bough to bough, catching and hanging by its long, strong tail, much as does our opossum, a cousin, or some other near relative of the Kangaroos. The general appearance of the Kangaroo is shown in the accompanying engraving. It will be seen that this animal has a small, mouse-like head, very short and ridiculously small fore legs, and hind parts of great size, ending in a tail of a weight and length entirely out of proportion to the fore part of the body. The Kangaroos range in size all the way from a hare up to the height and weight of a large sized man. In some respects the Kangaroo resembles a toad, because "when it stands it sits, and when it runs it jumps." It is to be presumed that the first question a boy would ask is: What is the tail so big for? At first sight it might be supposed that this large extremity was for protection—a fighting member—a weapon of defense; but this, we are told, by those who have seen the Kangaroo in its home, is not so. Some have thought it was to aid in walking—a fifth leg—but this animal does not do much walking, and when it does, it does not walk on or with its tail. The tail is mostly used to break the fall as the Kangaroo strikes the ground after it has taken a leap, which is often twenty feet or more. The Kangaroo is a rather savage animal, and an old one will frequently kill the dogs that are used to hunt them—and when cornered have done severe injury to the hunters themselves. The Kangaroo clasps the dog or man by its short fore

legs, and then scratches and tears its victim with the long, sharp claws of its hind legs. Sheep-raising is one of the leading industries of Australia, and the Kangaroos are troublesome to the farmers, as they destroy

A PAIR OF KANGAROOS.—(From a Photograph by Schreiber).

large quantities of the valuable pasturage. Kangaroos go in flocks, somewhat as our sheep do, and are seldom found entirely alone. It is seldom that the flock is large, usually six to ten, with an old one as the leader. They are valued for both their skin and flesh, and are hunted and killed in large numbers by the natives of Australia. The hunter must be very cunning to be successful in capturing his subtle game. The hunters usually go in hands, and with their plot and plan well understood by all those engaged in the chase, cautiously come upon and surround a number of Kangaroos that may be feeding quietly upon a hillside or valley. The animals, quick to take any alarm, will then hop away at a rapid rate, except those that have fallen victims to the savage hunters. Perhaps the most interesting thing about Kangaroos is the way which they care for their young. When the baby Kangaroo is born, it is very small, not much more than an inch in length, and entirely unable to run about or care for itself. The young animal is placed in a pouch on the under side of the mother, and in this "cradle" the little Kangaroo passes the early days of its life. When it gets larger and stronger it occasionally leaves its pouch, and hops about, nipping the green and tender herbage, but so soon as any danger is seen it scrambles back to its pocket of safety. Nearly eight months pass before the young Kangaroo leaves the pouch, then weighing about ten pounds, and from that time on seeks its own food and becomes its own protector.

**A Puzzle Picture.**—The ice is somewhat broken up; and in the back-ground a mountain of this cold solid describes its rough and ragged outline against the foreboding sky. But is this all? Does not the reader find more than a desolate polar scene? Though we may not recognize any of our friends, is there not something

present suggestive of life? The careful observer may be able to at least exclaim, Where and when shall these three meet again. Do you meet with them, reader?

Illustrated Rebus No. 481.—The advice to be found in this Rebus is especially for the young.

## The End of the Year Soon at Hand. Christmas.

There is something sad in the thought that 1880—a year so full of hopes fulfilled and youthful joys realized—is soon to take its place among the eighteen hundred and seventy-nine of its fellows in the silent halls of history and memory. The months of winter, with the skat-

happy "passing away" after all. The reality of the situation did not come upon the youthful mind until it awoke to the cold and chill of some dreary December morning, when all is dead without, and there is not any too much life within. It is then that the "Melancholy days have come, the saddest in the year." It is then that the white covering that nature has put on suggests the snowy locks of old age, and that a funeral must soon

ing preparations for Christmas. I can not go into any details of what this one of the family, or that of some other family, is doing for Christmas, only it may be said that many hands are active over work that is hid from the public gaze. "It is more blessed to give than to receive;" but to surprise in the bestowing of gifts is better than all. It has grown to be a sort of second nature for young and old of all classes and conditions of life, to be

THE OLDER MEMBERS OF THE FAMILY PREPARING FOR THE CHILDREN'S CHRISTMAS.

ing on the pond, and the coasting on the hillside, went all too quickly away, and the warm days of spring—lengthening, lazy days—came with the singing of happy nest-building birds, almost before we thought the songsters had reached their southern winter homes. With the heated days of May many a boy sought the shade of the leafy trees by the side of the pond or stream, and as he drew, with shouts of triumph, the shining, finny swimmers from the water, he thought, if he did not say: Would that springtime might always last, and fishing and fun be my lot forever! But the days of May soon lengthened into June, and the bright spring flowers gave place to fields of waving grain, and the planted crops were hoed—perhaps somewhat reluctantly—until the monotony of the corn-field was broken by the washing and shearing of the sheep. Then came July—hot July, with its memorable day, "The Fourth"; the day when, of all the year, the "Young America" that is in one, bursts forth with trumpet blast, and the booming of the sunrise gun. This hot month ranks far above the hotter one that followed slowly on her track—the sultry August—because it is the one in which our land was made free. All through the summer the gardens furnished their abundance of fine fruits—fruits that grew close upon the ground—fruits that hung in clusters on curved and briery shrubs—fruits that were knocked from the favorite orchard trees before they are half-way ripe—and fruits that grew, but few know where, save the foraging child who found them. But when the year began to ripen into the mellow autumn, the boys and girls as well, wished that the days would not shorten as they so evidently were doing. There were nuts to gather on the hillside—the chestnuts, shagbarks, butternuts—all this preparation for winter takes time, and it needs to be done early, or the squirrels and other unfriendly animals will strip the trees. Fall is also the season of the fairs; and with the fruits, the rich tints of the autumnal forests. Thanksgiving Day, the elder casks hursting full of amber sweetness, the golden pumpkins, and the staring and startling lanterns which are made from them, all these, and a thousand other attractions made the dying of the year rather a

be held, and the aged year laid away in a silent grave, beneath the frozen clouds and the still colder snow. But the picture of the end of the year is not so sad as this; it has a brighter and more cheerful ending in many a household; in fact, it is a happy, joyful gathering to see "the Old Year out and the New Year in." I think no one will dispute me when I say that into the last fortnight of the old year and running over into a few days of the new, there is crowded more sport, fun, real solid enjoyment for both young and old, than any other equal period of the year. This is the time of the Holidays,

them have a generous feeling and regard for others. If Christmas had no loftier meaning, and led to no higher and nobler thoughts and actions, than that of pure and simple giving—giving for the good feeling that it brings to the one who receives, and the double blessing to the one that bestows—it has not become a holy Holiday in vain. I should like to be present when this family, now separated, shall be united, and there is no doubt but what the reunion will be a pleasant—a joyous one, and the old and young together will have a happy day. The three generations will have a common bond of sympathy, and

THE YOUNGER MEMBERS AND WHAT THEY HAVE PROVIDED FOR THE COMING HOLIDAY.

and includes that day of all days—Christmas: the anniversary of that bright dawn in the East when all creation rejoiced and "the morning stars sang together." While this day is "yet afar off," thousands and thousands of people, old and young, are laying their plans and mak-

all hearts will beat to the sweet music of love—a music that it is hoped will never cease to roll. May the good Father bless them all, and may the day be a merry, merry Christmas. That this may be the portion of every one of my young readers, is the wish of your  
UNCLE HAL.

# A 16-PAGE STORY PAPER

**THREE MONTHS FOR 10 CENTS.**

Before subscribing for any Literary paper or magazine for 1881, we want everybody to see and read **The Cricket on the Hearth**, believing that we can offer you a brighter and more readable paper, and better inducements in the way of elegant and valuable premiums, than is offered by any other journal in the U. S. for the same amount of money. That every one may satisfy themselves of the truth of this assertion, we have decided to send our paper on trial for the last 3 months of this year, to any address, for the small sum of **10 cents**, (in silver or postage stamps,) which will barely cover the cost of postage and mailing, making the paper an **absolute free gift** to anyone who will send for it. Make up a club of five 3-months' subscribers among your friends, and send us 50 cents, and we will present you with an extra copy free for your trouble. By taking advantage of this offer you will receive every issue of the paper from October to the end of the year, including our elegantly gotten up and superbly illustrated Holiday Number, also the large and handsomely illustrated Premium Supplement accompanying it. Two new and brilliant serial stories are commenced in the paper during the term of this subscription. **THE CRICKET ON THE HEARTH** is an old established and very popular Illustrated Literary and Family Paper, (size of Harper's Weekly,) published at \$1 per year, and each issue is bristling with splendid stories, sketches, poems, useful hints, etc., making it just the paper for the family circle. This most liberal offer is made solely for the purpose of introducing our paper into new homes, and we, we not confident of obtaining your subscription for another year, we could under no circumstances afford to make it. Let all who see this notice take advantage of our splendid offer. We guarantee you the worth of your money three times over. Write at once. Do not miss this chance! Address, **MOORE & WILSON, Publishers, 245 Broadway, New York.**

**BOWKER FERTILIZER CO.,** 3 Park Place, New York, 43 Chatham St., Boston, Mass.

## SEEDS LANDRETH'S

To all who have occasion to purchase Seeds:

It is manifest that from **Good Seeds** only can good Vegetables be obtained; yet we see those who exhibit sound sense in most affairs of life, heedlessly purchase seeds of doubtful quality and character. The superior character of **LANDRETH'S** has been substantiated beyond all question. We therefore invite all who are not already purchasers of Landreth's Seeds to give them a trial. Those remote from Druggists, Grocers and others selling our Seeds, can be supplied by us direct at reasonable prices. Ask your Storekeeper for **Landreth's Seeds** in original sealed Packages, or drop a Postal Card for prices and catalogue to **DAVID LANDRETH & SONS, Philadelphia Pa.**

## To Seedsmen, Florists, and Dealers in Holiday Goods.

A full line of **Bulbs, Grasses, Mosses, Pampas-plumes, Immortelles, Glass Shades, Ferneries, Imported Wicker Baskets, Bouquets and Baskets** of dried natural Flowers and Grasses. ## BOLSTER SPRINGS FOR FARM WAGONS. Made of Best Oil Tempered Steel. SOMETHING NEW!

They save largely from wear and tear in every part of the wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over three years, and are a pronounced success. No Teamster or Farmer can afford to be without them. We want Agents everywhere. Send for description and prices, and mention this paper.

**SEMPLE & BIRGE MFG. CO., St. Louis, Mo.**

Our large illustrated Seed Catalogue of everything for the Farm or Garden **MAILED FREE TO ALL**. It costs nothing and may save you a great deal. Send for it at once. **BENSON, MAULE & CO.,** 223 Church St., Phila., Pa.

Manufactured by **WHITMAN AGRICULTURAL CO.,** ST. LOUIS, MO.

## THE PLANET JR. GOODS.

Let every man, woman and child, whether interested much or little in working the soil, send now for our carefully written catalogue. We want **Farmers** who grow anything that has to be either planted or cultivated, to study out our combined Horse Hoe, Cultivator, and coverer; **Market Gardeners** who have acres upon acres, on each of which our Double Wheel Hoe will save its cost yearly, to examine the merits of our fine garden tools; and every one who has even a small vegetable garden, to read closely what the Firefly Hoe and Garden Plow will save them in time, labor, and money. Our catalogue is free to all, and we want all cultivators of the soil to read and be convinced that we do not make a single tool as a plaything to be bought only by the rich, but that every one of them is a practical all-day tool, made expressly to save time and labor. **S. L. Allen & Co.,** 229 Market St., Phila., Pa.

**SALEM IRON WORKS, SALEM, N. C.**  
**C. A. HEGE,** Proprietor.  
The Simplest, Cheapest, Best, and Most Accurate.

No. 279 Washington St., N. Y.  
Rel., Irving National Bank, New York City.

# The Reason Why

The Robbins Washer and Bleacher is the best device ever invented for washing clothing is, 1st, it does away with all labor, so that a mere child can do an ordinary washing. 2d, it will do the work better, quicker, and cleaner than it can be done in any other way; 3d, it will not wear or injure the most delicate fabric; and, 4th, it has been successfully used during the past six years by thousands of families in all parts of the United States. These are surely common sense reasons, and no housekeeper in the land can afford to be without one of these wonderful machines. They are truly Worth their Weight in Gold—as the evidence of the tens of thousands now using them fully attest. The strongest evidence we can offer to the readers of the "Agriculturist" that all our claims are strictly honest and true, is the fact that the publishers have from time to time given us very flattering notices, and they are not the men to puff or recommend anything unless they know fully whereof they speak.

The Washer is perfectly simple in its principle, and needs only the most ordinary common sense to successfully operate it. It can not wear out or get out of order.

If you have any spare time during these winter months, you can not do a better thing than send for a sample, give it a trial, and then act as agent for us. As we allow a liberal commission to agents, you can turn your time to very profitable account by working for us.

We send the Washer by express—all charges paid—to your nearest railway express office, in any part of the United States east of the Mississippi and Missouri Rivers; also in Kansas, Nebraska, Arkansas, Louisiana, or Texas, on receipt of \$3.50 in Registered Letter, P. O. Money Order or Bank Draft. We do not send any orders C. O. D.

Address **BISSELL MFG. CO.,**  
50 Barclay Street, New York.

## 127 FRIENDS! If you are in any way interested in BEES OR HONEY,

We will with pleasure send you a sample copy of our MONTHLY GLEANINGS IN BEE CULTURE, with a descriptive price-list of the latest improvements in Hives, Honey Extractors, Artificial Comb. Section Honey Boxes, all books and journals, and everything pertaining to Bee Culture. Nothing Patented. Simply send your address on a postal card, written plainly, to  
A. I. ROOT, Medina, Ohio.

# WELL I AM SURPRISED! SO IS EVERYBODY.

Why? Because the illustrations exactly represent the 18 k. Rolled Gold Solid Rings we absolutely Give Away! In addition, we will engrave any name, initials, motto, or sentiment desired on the inside, pack it securely, mail it postpaid, and guarantee it to reach you safely, warrant it to wear, and prove a suitable and valuable present for any lady, gentleman, or child. "How can you do it?" you ask. Let us explain: 1st, we own the old Saturday Evening Post, of Philadelphia, and have ample means to do all we promise; 2d, we want 50,000 New Subscribers, and as we generally get what we want, we determined to spend \$50,000 to get them, if necessary. Read our offer carefully, and you will agree with us that we shall get them. **OUR OFFER:** Upon receipt of One Dollar, on or before January 15, 1891, we agree to send to any new subscriber, The Saturday Evening Post, postpaid, weekly, for 6 months (26 times); and we further agree to send, as a Premium Gift, an elegant plain 18 karat Rolled Gold Solid Ring, with any name, date, motto, initials, or sentiment engraved on the inside, postpaid. We also guarantee its safe delivery, warrant it to look well, to wear for years, and if any first-class jeweler will say the Ring alone is not worth the amount you have paid for the Post and ring, we will cheerfully refund the money. We mean and will do just what we say. We want a large list of subscribers in your neighborhood, and we know, after you receive your Ring and the Post, you will show the paper to your friends, refer to its merits, and advise them to subscribe, as we have recently reduced the price from \$3.00 to \$2.00 a year.

**CLUBS.**—A club of ten ordered at one time, accompanied by \$10, entitles the sender to Post and Ring, free. A club of five ordered at one time, accompanied by \$5, entitles the sender to either the Ring or Post 6 months. Every club subscriber receives the Ring premium.

### "TIME TRIES ALL THINGS."

The Post is not an experiment; it is the oldest literary and family paper in America, now in its sixtieth year, and this offer should not be confounded with the tempting promises of irresponsible parties. It is a large sixteen-page weekly, elegantly printed, folded, out, and bound. Its fiction is of the highest order—the very best thought of the best writers of Europe and America. It covers the whole field of a first-class family paper: has Fashion, Needlework, Fireside Chat, Answers to Inquirers, Scientific News, and other departments, Sketches, Narratives, etc. Each volume contains twenty-six Serials, from the pens of the best living authors, and upwards of five hundred short stories, and furnishes an amount of strictly first-class reading matter, alike interesting to every member of the home circle, which can be obtained nowhere else. At \$2.00 a year the Post is the cheapest paper in existence to-day.

The Post has never missed an issue, and as to our reliability we refer you to any bank, express office, or reputable business house in Philadelphia.

If this unparalleled offer does not interest you personally, or on behalf of some relative or friend, please call it to the attention of some one who will appreciate it.

This offer will not be good after the date named. In ordering send size, and state which of the two rings you desire, the Band or Half-Round. To ascertain the size wanted, take a slip of paper and place it around the finger you wish to fit, cut so it will just meet around the finger, send the slip to us, and we will send you a ring that will fit you.

N. B.—If not engraved, we will mail your ring on same day order is received; if engraved, your order will be filled within a few days. Address,

**THE SATURDAY EVENING POST, 726 Sansom Street, Philadelphia.**

\$1.25 a Year.

1881 "The Household Magazine of America." 1881

## ARTHUR'S HOME MAGAZINE.

Taking literary rank with the best periodicals of the day, it claims to be, in its peculiar characteristics and varied Departments, more thoroughly identified with the people than any other magazine of its class, going into their homes, not only as a power for good, but as a pleasant companion and friend, interested in all that interests the household, and ready to help, comfort, amuse, instruct, and delight all, from the youngest to the oldest.

### WHAT OUR SUBSCRIBERS SAY.

"Each year I have taken it contains at least twelve happy days—the days on which my magazine comes."

"I watch for your beautiful magazine eagerly."

"I should feel poor, indeed, if I were deprived of it."

"Accept my congratulations upon the brave spirit with which you refuse to pander to a vitiated public taste."

"I am a better wife, a better woman, a better mother for its sake."

"It always appeals to the higher side of our nature, lifting us up toward nobler things."

"Whenever I write to distant friends, I tell them of the merits of the Home Magazine."

"I feel as though I could not keep house without it."

"For six years I have, each month, greeted the arrival of you dear, delightful magazine with the affection I would bestow on a dear friend."

"I cannot send off my order without expressing, briefly, my gratitude for such a blessing as you magazine is to us, and to hundreds of women in our fair land."

"It fills a want in the household that I have long felt the need of; and, I am sure of this, that I only express the sentiments of wives and mothers all over the land."

"It is so thoroughly home-like and good."

"I thank you for giving us a magazine which holds up a high standard of life, and lifts one up to new and earnest endeavor toward the right."

"I wonder how I have done without your magazine so long. I hope never to be without it again."

Neuralgia; Rheumatism. Diet in Rheumatism; Low Spirits.

On Taking Cold, Preventive and Curative Treatment; Coughs, Catarrh, Malarial Fevers, Sore Throat, Weak Lungs, Curved Spine, Weak Eyes, Inflamed Eyes, Dry Skin.

Rearing Healthy and Beautiful Children. How Women may be Well.

Price \$1.00 per Year. Samples 10 cts.

### SPLENDID PREMIUM.

Every subscriber sending \$1.00 and 10 cents for postage, shall receive free a new book of over 200 pages, by Mrs. BERTHA MYER, entitled

**How to Govern Children.**

This work is the best book of its kind ever written, and worth its weight in gold to any parent. Price \$1.00. Also just out:

## Hygiene of the Brain and Cure of Nervousness.

By M. L. HOLBROOK, M. D.

"Get this book and read it, for it abounds in practical valuable knowledge."—*Chicago Inter-Ocean*.

### PART I. CONTAINS:

How the Nerves Act.

Has Nervous Activity any Limit?

Nervous Exhaustion.

How to Cure Nervousness.

The Cure of Nervousness (*Continued*).

Food in Nervous Disorders.

Fifty Important Questions Answered.

What our Thinkers and Scientists Say.

Nervousness in Girls.

On Headaches.

Resting the Brain.

Hunting as a Remedy.

Mental Hygiene for Farmers.

Recreation in a Work Shop, etc., etc.

Price, by mail, \$1.50.

It and Herald of Health \$2.00, without premiums; with premiums, \$2.10. Samples, 10 cents.

**CLUBBING**.—We will send THE HERALD OF HEALTH for one year and any 4th magazine, both post-paid, for \$4.25. The list includes the Atlantic Monthly, Harper's Monthly, Scribner's, Harper's Weekly, and Harper's Bazar. Add 13 cents for Premium.

THE HERALD OF HEALTH will be sent for one year, with St. Nicholas—\$3—for \$3.40; with Demorest's Monthly—\$3—for \$3.25; with the Phrenological Journal—\$2—for \$2.50; with the New York Weekly Tribune—\$2—for \$2.50; with any \$1.50 Monthly for \$2.10, with the Boston Journal of Chemistry—\$1—for \$1.15. Add 10 cents for Premium.

Catalogue of Health Books free.

M. L. HOLBROOK,  
13 & 15 Laight St., New York.

containing a great variety of items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Continued from Page 499.

In justice to the majority of our subscribers, who have been readers for many years, articles and illustrations are seldom repeated, as those who desire information on a particular subject can cheaply obtain one or more of the back numbers containing what is wanted.

Back numbers of the "American Agriculturist," containing articles referred to in the "Basket" or elsewhere, can always be supplied and sent post-paid for 15 cts. each, or \$1.50 per volume.

**The German Edition.**—All the principal articles and engravings that appear in the *American Agriculturist* are reproduced in the German Edition. Besides these, there is a special department, edited by an eminent German cultivator. Our friends can do us a good service by calling the attention of their German neighbors and friends to the fact that they can have the paper in their own language, and those who employ Germans will find this Journal a most useful and acceptable present.

**Bound Copies** of volume 39, and of every previous volume back to Vol. XVI. (1857), neatly bound, with gilt backs, Index, etc., are supplied at \$2 each (or \$3.30 if to be sent by mail). See Publishers' Notes, 2d cover page.

**Clubs** can at any time be increased by remitting for each addition, the price paid by the original members; or a small club may be made a larger one at reduced rates, thus: One having sent 6 subscribers and \$7, may afterwards send 4 names more and \$3, making 10 subscribers for \$10.00; and so for the various other club rates.

**Terms to New South Wales, New Zealand, Australia, Africa, etc.**—To several inquirers. Under the latest revision of the Postal Union Regulations the price of the *American Agriculturist* (either English or German edition), including postage prepaid through, will be covered by 7 shillings sterling per annum. This applies to the above countries, and to all others embraced in the General Postal Union. The simplest mode of remittance is by Postal Money Orders, payable in London, to the order of Orange Judd Company. These can be readily cashed in N. Y. City at a slight discount, which the publishers will cheerfully pay. For Club rates, (postage included), see our second cover page, and reckon 22 cents to the shilling sterling.

**The Care of Grindstones.**—The exposure of the stone to the sun has a tendency to harden it. And if one part be left in the water habitually it will grow soft, and will wear away faster than the other. If the trough is put upon movable supports in the frame, it can be adjusted to the stone without much loss of time.

**Mule Breeding.**—"D. G." The value of mules depends very much upon their size. Large mares are most profitable as a rule, and the larger the jack the better. Of course mere size should not govern in selecting breeding animals of either sex. Large well-formed jacks sell at a high figure, and are usually imported from France, Spain, or Malta. "Riley on the Mule" is the best hand-book we know on the subject; it treats of buying and handling mules, and briefly of breeding.

**Alders and Hardhacks.**—"A Subscriber," Long Hill, Conn., asks for some chemical that will, by a simple application, kill shrubs which infest pastures. To kill most kinds of brush, cut close to the ground in spring, and as soon as the young shoots start overstock with sheep. Or after the grass is gnawed down pretty short by cows and horses, turn in so many sheep that they will need to eat the brush to live. There is no "chemical" that will kill the troublesome plants, and spare the grass. Salt may be used, but not to kill the plants directly; it is to be applied fine, and sprinkled on the leaves when wet with rain. Cattle soon find it, and eat the shoots down close.

**Orchard Grass.**—"A. C. D.," Frederick Co., Md. You can sow Orchard Grass by itself or with grain (not buckwheat), on sandy or loamy soil. It may be sowed late in autumn, but on stiff soils it would be likely to winter kill. You would do well to plow this winter if you can, and sow without a "foster crop" as early in the spring as you can. Sow 6 or 8 lbs. of Clover with it.

## Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared especially for the *American Agriculturist*, from our record kept daily during the year, show at a glance the transactions for the month ending Nov. 10th, 1880, and for the corresponding period last year:

Extensive dealings have been reported during the month in Stocks and Bonds, prices of which have advanced materially, despite the scarcity of Money. More or less serious interruption to business operations resulted from the political excitement previous to election. A fair movement has been reported in most kinds of

general merchandise at, however, irregular prices, closing with more steadiness.... The leading kinds of domestic produce have been remarkably brisk, mainly in the home trade connection, though in good part for export. Food supplies here and in Europe have shown a decidedly upward tendency. Speculation has shown remarkable vigor, having acquired practical control of the home markets, thus, in large measure, determining the course of values. Grain has been worked up rapidly in price, on extraordinary transactions, especially in No. 2 Red and No. 1 White Wheat, No. 2 Corn, the principal grades of Oats, prime Rye, and the favorite qualities of Barley. Export purchases have been checked, in part, by the rise in values, which has been most pronounced within the last week or two.... Flour has been on the advance, in sympathy with Wheat, and has met with a much readier sale.... Provisions have been also quite active, especially Western Steam Lard, which leaves off buoyantly, with a lively call noted for stock, particularly in the option line.... Mess Pork, which ruled much higher early in the month under review, under speculative manipulations, broke sharply about the beginning of November, and closes about steady at the reduced figures. More demand has been noted for Beef and Beef Hams, at stronger rates. Butter and Cheese have been sought after to a moderate extent, and Eggs have been in better request.... A good demand has been noted for Wool, which has been quoted dearer and firm at the improvement.... Tobacco has been quoted steady, on a fair degree of activity.... Naval Stores and Petroleum close weaker and less sought after.... Hops fell in price early in the month, under free offerings, leading to more liberal operations for home use and shipment.... A dull market has been reported for Seeds, with values about as previously quoted.... Hay and Straw have been quoted higher, in a comparatively limited supply, and wanted.... Transactions in Cotton have been on a moderate scale, and generally at easier rates, as influenced by the weakness in the foreign markets and the depression reported from the Southern ports of outlet.... Ocean freights have been fairly active for Breadstuffs, and Provisions, and Cotton, but at variable figures, closing firmly, including Grain by steam to Liverpool, 15c. per bushel; London by steam, at 16c.; Glasgow, by steam, at 14c.; to Bristol, by steam, at 17c. per bushel; to Antwerp, by steam, at 14c. per bushel, and sail to Cork, for orders for vessels of average carrying capacity—say 3,000 to 4,000 qrs.—\$1.32 @ \$1.35 per qr. of 480 lbs.—Apples, by steam to British ports, at 84c. @ \$1.08, mostly at 96c. on continued heavy shipments.... The visible supplies of Wheat—embracing the hoards at lake ports, in transit, and on the seaboard—at latest dates, embraced about 19,118,000 bushels; of Corn, 19,365,000 bushels; of Rye, 897,700 bushels; of Barley, 2,612,000 bushels, and of Oats, 5,034,000 bushels, against about Sept. 1, an aggregate of 14,716,000 bushels Wheat, 19,012,000 bushels Corn, 574,000 bushels Rye, 265,000 bushels Barley, and 1,626,000 bushels Oats.

## Prices for bees per lb. estimated dressed weight:

	Range.	Larger Sales.	Aver.
WEEK ENDING			
Oct. 11.....	6 1/2 @ 11 1/2 c.	8 1/2 @ 10 c.	9 c.
Oct. 13.....	6 1/2 @ 11 1/2 c.	8 1/2 @ 9 1/2 c.	9 c.
Oct. 25.....	6 1/2 @ 11 1/2 c.	8 1/2 @ 9 1/2 c.	9 c.
Nov. 1.....	6 1/2 @ 11 1/2 c.	8 @ 9 1/2 c.	8 1/2 c.
Nov. 8.....	6 1/2 @ 11 1/2 c.	8 @ 9 1/2 c.	8 1/2 c.

**Bees.**—A dull market has prevailed for most of the month. As this report closes, the weather is warm and the markets are filled with meat, some of which is spoiling on the butcher's hands. Texans sold for 6 1/2 c.; Colorados, 7 1/2 c.; poor to fair natives ranged from 7 @ 8 1/2 c.; extras at 11 @ 11 1/2 c. A fancy steer of 2,700 lbs. sold at 1 1/4 c., to dress 59 lbs.... **Milch Cows.**—There are more cows coming forward, and the demand is better supplied than for some time. Prices continue steady at \$30 @ \$55 per head for common to prime cows.... **Calves.**—Grassers were doing a little better under the lighter supplies, selling at 1 1/2 @ 2 c. per lb. live weight; Fed calves at 2 1/2 @ 3 c., and common to prime veals at 4 @ 7 c.... **Sheep and Lambs.**—The market closed with prices strong for good stock. Lambs were also in good demand, and prices firm. Sheep sold from \$3.62 1/2 for poor Kentucky to \$5.60 for choice Pennsylvania wethers. Lambs ranged from 5 1/2 @ 6 c. for common to prime.... **Swine.**—Arrivals very liberal, and the tone of the market dull. Ohio hogs are being held for 5 c.

**The Horse Market.**—Receipts from all points are moderate. There is some demand for large draft horses, which sell for \$250 to \$350. Well-matched driving teams are wanted at \$800 to \$1,000. Several lots of stallions

have been imported recently. Messrs. Powell Bros. received ten powerful Clydsdale stallions, ranging in weight from 1,800 to 2,000 lbs. These fine horses go to Crawford Co., Penn. W. H. Jordan, of Waverly, Iowa, received some fine prize Cleveland bays. We saw both of these lots of imported horses at Stoddart's stables.

Walton, Whann & Co.'s Raw Bone Phosphate, per ton.....	40.00
Gypsum, Nova Scotia, ground, per ton.....	5.00

**Lightning.**—"G. B. S.," Boonville, Mo. It is no certain indication of mineral deposits to have the lightning strike and tear up the ground; in fact it is no indication at all. Metallic veins are good conductors of terrestrial electricity, so are veins of moisture in the ground. For this reason the lightning may be more likely to strike near moist ground, or near metallic veins, than elsewhere.

**Sore Shoulder.**—"J. S.," Warrenton, Va., has a horse which had a very sore shoulder, and he is now afraid to use a collar for fear the sore will break out again. Try a Dutch or breast collar; that will probably not bear on the same spot. If that, too, irritates the sore, give the animal a rest until it is well.

**Whitman and Burrell's Silo.**—The names of Whitman and Burrell are familiar to all our readers as extensive advertisers of dairy implements and appliances. Not only do they make and sell dairy utensils, but they use them on their dairy farm, near Little Falls, which they have recently equipped, mainly for experimental purposes. An important feature of this dairy establishment is a silo sufficiently large to test the preservation of corn-fodder as a part of dairy management. The silo, completed last summer, is 56 feet long, 16 feet wide, and 22 feet deep, built in the most thorough manner, and divided by a brick partition, crosswise, into two compartments. The corn from eight acres was cut and stored away in the early part of September, covered with tongued and grooved boards, over which planks are laid cross-wise and weighted with about 50 tons of stone on each silo. The cost of the fodder as stored was 80 cents the ton. Feeding will commence in December, and we hope the friend who forwarded the above facts, will report the opening of the silos and the condition of the fodder, and as to its feeding results.

**Currants.**—"J. M. D.," wishes to know if currants can be raised on a hill-side with a slope to the east; where the plants can be had, and what fertilizer can be used in the absence of wood ashes.—Any good soil that will bear sixty bushels of corn to the acre will be suitable for this crop. The slope, if not so steep as to wash badly, is not objectionable. We should prefer a clay loam well drained to gravel, but this fruit is not so particular about a soil as some others. Farm-yard manure will answer a good purpose. Almost any nursery or dealer in small fruits will furnish either cuttings or the plants at reasonable rates.

**Danger in the "Silos."**—We are impressed with the importance of warning people who have put their corn-fodder in tanks, especially in deep ones, of the dangerous carbonic acid gas—the "choke damp" of mines and wells. A farmer near Sing Sing, used an old ice-house for pitting his corn-fodder; on Saturday night, when they knocked off work, there were some seven or eight feet of fodder cut in half-inch bits, and well trodden down in the pit. On Monday morning it had settled considerably and one of the hands jumped in and was treading about on it to see if it had settled evenly, when he felt dizzy and faint; the thought of "choke damp" flashed through his mind, and he called out to have a ladder lowered to him. This was done just in time, and he half crawled and was half hauled out. His head was four or six feet above the worst of the "damp," for it is very heavy. Had he fallen he would have been drowned in the gas, as effectively as in water, without a struggle or a murmur. When going into a pit never fall to lower a lantern first, for half a minute, and if it burns brightly the air of the pit is fit to breathe.

**The Poultry Shows.**—The Exhibitions given in this list are devoted wholly, or in great measure to poultry. These shows come after the other fairs are past, and when farm work is not so pressing, are widely distributed through the U. S., and should be well attended by all who take an interest in fine well-bred poultry:

Rensselaer Co. Poultry Ass'n...East Albany, N. Y. Dec. 8-13  
Tolono Pet Stock Ass'n...Tolono, Ill. Dec. 14-16  
Terre Haute Pet Stock Ass'n...Terre Haute, Ind. Dec. 14-21  
New Jersey State Society...Newark, N. J. Dec. 14-21  
Pottstown Pigeon Club...Pottstown, Pa. Dec. 15-17  
Dist. of Columbia Ass'n...Washington, D. C. Dec. 15-22  
Eastern N. Y. Fanciers' Ass'n...Troy, N. Y. Dec. 22-23  
White River Valley Ass'n...Anderson, Ind. Dec. 23-25  
Poultry & Pet Stock Ass'n...Germantown, Pa. Jan. 3-6  
Logansport Poultry Ass'n...Logansport, Ind. Dec. 28-J. 1  
Wide Awake Poultry Club...St. Johnsbury, Vt. Dec. 28-30  
Windham Co. Brattleboro, Vt. Jan. 4-7  
Southern Mass. Ass'n...New Bedford, Jan. 4-7  
Saginaw Valley Ass'n...East Saginaw, Mich. Jan. 11-14  
Champlain Valley Ass'n...Burlington, Vt. Jan. 11-14  
Central Mass. Ass'n...Worcester, Mass. Jan. 11-14  
Springville Ass'n...Springville, N. Y. Jan. 12-14  
Cleveland Poultry & Pet Stock...Cleveland, O. Jan. 12-19  
Western Penn. Society...Pittsburg, Pa. Jan. 13-19  
Western Poultry Club...St. Louis, Mo. Jan. 12-19  
Lancaster Poultry Ass'n...Lancaster, Pa. Jan. 14-19  
Macoma Poultry Ass'n...Macoma, N. H. Jan. 18-20  
Vermont State Poultry Ass'n...Rutland, Vt. Jan. 18-21  
Union Pet Stock Ass'n...New Berlin, N. Y. Jan. 18-21  
Northern Indiana Poultry Ass'n...Fort Wayne, Ind. Jan. 18-22

**Grasses for Names.**—The number of specimens of grasses that are sent to us for determination, especially from the South and West, indicates a general desire to know more about our native grasses, and that attention is directed toward the improvement of the pastures. "M. M. M., Manitoba. The grass is not a native, but is the Perennial Rye-grass, *Lolium perenne*, of Europe. It is regarded as a valuable pasture grass, but not so good for hay, as Timothy. The common "Cra-grass," *Panicum sanguinale*, has been several times sent as Bermuda Grass, and now the "Mexican Drop-seed," *Muhlenbergia Mexicana*, comes from "H. M. D., Martinsville Va., who asks if it is not Bermuda Grass. Although the Drop-seed has long underground running stems, the portion above ground is erect, while the Bermuda creeps along the surface. Besides, the flowers of the Bermuda are arranged upon short stems which are attached at the end of the upright stalk, and spread like the fingers of a hand, as shown on page 105, in May last. D. Straog, Lincoln Co., Tenn., sends "Tall Red-top," *Tricuspis sceleroides*, a tall, coarse species, about which little is known as to its value. In the same parcel was the "Proliferous Panic-grass," *Panicum proliferum*, which also came from "M. H. C., Clarksville, in the same State. This in moist soils grows 4 to 6 feet high, with broad leaves, large succulent stems, and bears copious panicles of seed. All that the writers upon grasses have recorded in relation to this species is that: "Cattle are very fond of it." It seems to be deserving more attention than it has yet received, and we hope that our Tennessee friends may make the trials they propose and report results.

**Wild Hops in Manitoba.**—A lady in Manitoba, "M. M. M.," wishing to have hops, gathered the seeds from a wild vine, and obtained one plant which bore remarkably large clusters, some of which she sends, and asks several questions. Seedling hops are not always like the parent; half-a-dozen or more varieties are in cultivation, differing in color of vine, size, and shape of cluster, productiveness, etc. In cultivation, the old stools are divided, or sets, which are shoots with a piece of root attached, are planted. Our correspondent says that only two of her seedlings bore, evidently not being aware that the plant has separated flowers—the staminate and pistillate being in different plants. In practice, about half a dozen staminate plants are set to the acre. Large hops are not of necessity the best, as their value depends upon the quantity of small resinous grains, called *Lupulin*, they contain; these are found at the base of the scales of the cluster near the seeds; and when the hop is rubbed between the fingers they adhere to them. The abundance of these, the character of the odor, and the care used in curing, as shown by the color of the hops, are all considered in judging of their quality and value.

**American Apples Abroad.**—The almost entire failure of the apple crop in Great Britain, and the great abundance in our own orchards, have led to the shipment of this fruit to an extent never before known. Formerly a few barrels of very choice apples were sent over, and these brought handsome profit to the shipper. This year the consignments have been so large, that some thousands of barrels were offered in London in a single day. There is some danger that the reputation of "American Apples" (for they are seldom sold under any other name than "American"), may suffer from the sending of fruit of indifferent quality. There is perhaps no apple that bears transportation better, or is a better keeper than the Campfield. It is a good-sized, showy red apple, but it is sweet. In England, sweet apples are unknown, and not appreciated; the selling of a lot of Campfields, a few years ago, as Baldwins, did much to bring that excellent fruit into disfavor. If in the wholesale shipments now going on, varieties are sent

that show that "American" does always stand for a firm-fleshed, rich and high-flavored apple, it will have an unfavorable effect upon the trade in future years.

**Practical Azalea Culture,** by Robert J. Halliday, Florist, Baltimore Md. Sometime ago we noticed "Camellia Culture," and we now have a companion treatise on the Azalea, by the same author. Works upon a specialty are restricted in their usefulness to those who cultivate the plant upon which they treat, but to such they are of great value, especially when, as in the present case they are by one thoroughly competent to teach.

**Stone Fences—Two Suggestions.**—C. G. Tousey, of Dutchess Co., N. Y., sends to the *American Agriculturist* the accompanying sketch, and writes that he has tried the following plan with entire success, on both wet and dry soil:

"After the wall is laid, three plow furrows are turned against each side; the first, one foot away, and not to be disturbed. It stakes and rider are to be used, these are now driven. The earth of the other two furrows is used to make a stop bank, two feet high, against the wall, on each side, as in figure 1. This will keep both wall and stakes in place. If locust stakes are used, the fence will not need overhauling in a lifetime."—We suppose Mr. T. sows grass seed to form a sod upon the bank—an important matter, for all stone walls may be strengthened in the above method. Dry soil

Fig. 1.—END OF WALL.

Fig. 2.—LONGITUDINAL VIEW OF STONE WALL.

expands very little in freezing, while a water-saturated soil, like water itself, swells and shrinks about one-eighth of its bulk in freezing and thawing, and this is what heaves fence posts, and throws down or disturbs stone fences or walls. A drain under a wall or on the side of it, that will keep the soil dry, will prevent disturbance by frost. The ditches above described are wasteful of land, though they secure immunity from frosts, and also save their depth in the height of wall required. Figure 2 shows a longitudinal view of the wall.

**Fisher's Grain Tables.**—This is a little work which will tell at a glance the value of any number of bushels or of pounds of any kind of grain at a given price—in fact a "ready-reckoner," as applied to grain. Besides the grain tables there are others useful for farmers, and dealers in farm produce. Price by mail, 40 cts.

**Sending us Papers.**—It often happens that a letter comes to the Editors in which our attention is called to an article that appeared in a local or other paper, and informing us that the paper has been sent. Unless the paper is sent to one of the editors by name, or the article is conspicuously marked, there is little probability of our seeing it. The clerks who open the mail have many hundreds of papers to handle each day, and unless there is something to arrest their attention, such papers are likely to be passed over as regular exchanges. The better way is to cut out the article, mark the name of the paper and date upon it, and inclose it in the letter.

**Lice on Canary Birds.**—"H. W." An old German breeder of Canaries, whose management we used to watch with interest, when he suspected that a bird was troubled with parasites, would cover the cage over night with a piece of cotton flannel, the soft side down. In the morning the insects would be found gathered upon the flannel, which was scalded and ready to use again.

**Orchard Grass Seed.**—"O. J. M., Jay Co., Ind., wishing to sow many acres to Orchard Grass, proposes to raise his own seed, and asks how to do it. It being important to avoid the seeds of weeds, a field that has been in some well cultivated crop should be selected, prepared as if for a crop of grain, and the grass seed sown in early

spring. For hay, very thick seeding is required, but a hushel and a half of good seed will be sufficient for this purpose. The grass should not be cut until an examination of the heads shows that some of the seeds have begun to ripen. The grass may be cut and treated in the same manner as ordinary hay, but it is much better to cradle it, and bind it in sheaves like grain. When cured, it is thrashed with a flail and the seed cleaned.

**Lip Salve.**—"S. M. T." This as sold in the shops is an ointment of white wax, spermaceti and oil of almonds, colored red by Alkanet root, and perfumed with the oil of rose. It has no special curative qualities; mechanically it protects cracked lips from the air, and thus relieves pain. Pure mutton tallow, if not so pleasant, as to its odor, will be equally effective.

**Grass Seeds.**—There is no seed in respect to the quality of which so little care is given as grass seed. It is not unusual for farmers to gather up the sweepings of the hay lofts and sow them. Such rubbish, of course, contains some grass seeds, but it is largely mixed with the seeds of weeds. It will pay every farmer who sows much grass seed to keep a portion of a meadow exclusively for seed bearing, and to carefully remove all weeds. To most persons grass is grass, without considering that grasses vary. Some years ago an English seedsman, finding some unusually large stools of Orchard-grass in a field, saved the seed and sowed them; he continued to breed, so to speak, from this stock, and now gets a fourth more for this seed than the common kind sells for.

**Stereopticons and Magic Lanterns.**—With the Magic Lantern a magnified picture is thrown upon a white wall or screen, where it can be seen by a large number. Stereopticon is a recent name for an improved Magic Lantern, and is a most excellent means of illustrating lectures or for exhibiting views of scenery, buildings, etc., merely as an entertainment. Having occasion to use a Stereopticon some months ago, we procured one of J. H. McAllister's, which was most satisfactory in its operation. The improved Magic Lantern for family amusement is offered in our Premium List, and the Stereopticon is described among the advertisements.

## Bee Notes for December.

BY L. C. ROOT.

### COMMENCING BEE-KEEPING.

Those interested in our pursuit should spend some portion of their leisure during the winter months in acquiring information in regard to the most approved methods in the apiary. It is desirable that those who wish to commence bee-keeping should become familiar, not only with the necessary, but the best fixtures, in order to begin intelligently, and to continue in the right direction. [The author modestly refrains from saying so, but the Editors have no hesitation in stating, that the best work in the language is Quinby's "New Bee-Keeping," revised and largely re-written by Mr. Root. This gives the most recent methods and appliances in bee-culture, and is a most complete guide to all the operations of the apiary. Post-paid from this office for \$1.50.—Eds.]

### CAUSES OF FAILURE.

Many beginners do not attach sufficient importance to this matter of preparation by reading, and often find it necessary to make many changes, thereby incurring much needless expense. Others become discouraged and drop the business in a year or two, when, if circumstances had been more favorable, they would have attained, with application, reasonable success. It is a mistake for beginners to hope to reach at once, results equal to those who have had years of experience. Those who indulge in this idea, will be sure to meet with disappointment. It is a common mistake with modern writers upon bee-keeping to offer too glowing inducements to the inexperienced.

In my opinion there are, at the present day, two distinct classes, taking extreme ground in relation to our interests, both of which I conceive to be in error. One class endeavors to induce all, without regard to fitness, to engage in bee-keeping, assuring them, by delusive statements, that it is the highway to prosperity. The other, on the other hand, says that the business should only be conducted by specialists, who devote themselves exclusively to it. I am often told that I am helping to instruct the public to produce such quantities of honey, that those of us, who make it a special business, cannot dispose of our own honey at figures that will make it remunerative. I admit that there may be some truth in this, if we are to be controlled by selfish aims alone, but I cannot believe that this is the proper view to take of it.

The facts are these. All over this beautiful land, hlossoms are secreting honey which is passing away and being wasted, at the very doors of those who might, with a proper understanding of the means, secure it as a wholesome article of food. Again there are those in nearly every community, who are keeping a few swarms

of bees in box hives, and in the old way securing little or no profit. This is the class I desire more particularly to influence. One of the earliest lessons I received was, that whatever it paid to do at all, it paid to do well. If it pays at all to keep bees in the manner alluded to, it certainly must pay much better to keep them after an improved method.

It is not true that all can keep bees successfully, but only such should undertake it as are by nature adapted to it, and will give it the same thorough continued application that is required to make any branch of business profitable. If one desires to understand how to commence rightly, and to become familiar with what is required to conduct bee-keeping satisfactorily, secure some practical work on the subject which does not represent either class of extremists just mentioned; begin moderately, and grow into the business as experience increases.

#### QUESTIONS AND ANSWERS.

**UNITING BEES.**—"I could get bees from those who brimstone them, by merely paying for extra trouble, but cannot ascertain whether it would be advisable to unite such bees with one's own, or how it should be done."—I would advise securing all such bees rather than see them destroyed. There is an advantage in having stocks very populous during winter. They may be safely united by smoking all thoroughly.

**SIZE OF OPENING.**—"Will you please state in the *American Agriculturist* the proper sized opening to a hive, to be used in connection with a swarm catcher, one that will allow free ingress and egress to the worker bees, and at the same time prevent the possible escape of a laying queen?"—An entrance  $\frac{5}{32}$  of an inch will accomplish this, but it is seldom or never desirable, to use so small an entrance. The workers are too much hindered by it. Swarms may be prevented from leaving in the owner's absence, by clipping off one wing of the queen, and removing all queen cells once in eight days. It is far better to control the desire to swarm, which may usually be done by making moderate artificial increase.

**COMB FOUNDATION.**—"What kind of comb foundation shall we use in boxes?"—I find that the lightest grades of foundation now made, are not best for boxes. Medium weight is preferable.

**Seeding to Grass with Buckwheat.**—"S. A. S.," New Haven Co., Conn., writes: "In the November No. of the *American Agriculturist*, under 'Grass Seed Sowing,' it is stated that grass will not probably do well with buckwheat if this makes a good stand. I have tried it, and with good success; the land was old, run out meadow, that is, cold, heavy, wetland, than could not be plowed until the last of May and first of June. The last of June I harrowed it thoroughly, and sowed very evenly one-half bushel of buckwheat to the acre, and four hundred pounds of ground bone to the acre, and harrowed, or rather double harrowed both in. With this was sowed one-fourth bushel of timothy seed to the acre, bushed in, and finished it by rolling. I can not imagine how, on that wet land I could have had a better stand of grass than I did, unless with turnips, as suggested, which method I think stands ahead of all others I ever tried. Heretofore I have sown the same lot to buckwheat, using one and one-fourth bushel of seed to the acre, and harvesting from 60 to 80 bushels from the lot. The reason I sowed the buckwheat so thin was simply to shade the grass from the burning July and August sun. I had no expectation of a crop of buckwheat to harvest. If I ever sow another lot of buckwheat, I shall not sow over one-half bushel to the acre. I would as soon seed to grass on land plowed only once from turf with buckwheat, as anything for June sowing. The land should be plowed one month before sowing, and thoroughly worked down with the harrow before seeding it. After the buckwheat comes off, top-dress the land with some fine manure or fertilizers."

**Will Hungarian Grass Founder a Horse?**—"O. A.," Califon, N. J. We have stated it very often, but it does not seem to be remembered, that Hungarian grass, if cut early, may be fed like other hay. If allowed to stand until the bristles around the seeds get hard, it will then be unsafe to feed it to horses. The value and the safety both depend upon the condition of the grass at the time of cutting.

**Annatto.**—"G. T. T." asks how to spell the name, and what the article is that is used for coloring cheese and butter. The spelling above given is that usually followed in this country, though we sometimes see it with a single n or t. In England it is usually written Arnatto or Arnatto. The article itself is the pulp which surrounds the seeds of a South American shrub (*Bixa Orellana*). The seeds are thrown into water, and when fermentation takes place their thin covering of pulp separates; when the water is evaporated, the Annatto is obtained as a stiff reddish brownish red paste, which is packed in baskets for exportation. It is of a dark

red color, and is used sometimes in domestic dyeing of cotton cloth. In South America the roots of the shrub are used in broth, and the paste itself is mixed with chocolate to both color and flavor it. Its chief use is to color butter and cheese, and it has for this use one merit—it is perfectly harmless. Though the quantity used by a single dairy is comparatively small, the aggregate consumed is very large. One of our advertisers, L. E. Ransom, is the largest importer of Annatto in New York, and there are several other importing houses.

**Pearls in Common Oysters.**—It is well known that the real pearl is caused by some foreign substance, such as a grain of sand, which has found its way within the shell of the pearl oyster. The animal being unable to get rid of this, covers it with the material with which the shell is lined. The interior of the Pearl Oyster and the fresh water Mussel (*Unio*), is bright and "pearly," and the pearls found in them have a similar appearance. The lining of the common oyster is dead white, like white chinaware. That often produces pearls, but they are always like the interior of the shell. A correspondent in Maryland sent, not long ago, several small pearls from the common oyster, with the request that we would sell them for him. Such pearls have no value whatever, as they are entirely without lustre. All that can be done with these oyster pearls is to keep them as curiosities.

**Personal Questions.**—"C. C. S.," Philadelphia, asks us to tell him in the December number where he "can get a situation on a farm." It is necessary to say from time to time that we do not answer such questions in the "Basket." Unless an answer to a question will be of interest to a number besides the one who asks, it is not given here. All purely personal questions, if it is possible to reply at all, are answered by mail.

## SEEDS

**Vegetable, Farm and Flower Seeds,**  
**FERTILIZERS & GARDEN REQUISITES,**

At Retail and Wholesale, sent to any part of the  
United States.  
Catalogues mailed FREE to any address.

**WM. H. CARSON,**  
**125 Chambers Street, New York.**

## LARGEST AND FINEST

COLLECTION OF  
**CLYDESDALE**  
**DRAFT HORSES**

Ever seen on the American Continent. Also,  
**HAMBLETONIANS,**  
And other strains of TROTTER HORSES, Holstein and  
Devon Cattle. Catalogues sent free. Address,  
**POWELL BROS., Springboro, Crawford Co., Pa.**

## SCROLL SAW DESIGNS.

Send for New Catalogue. L. H. Russell, Stratford, Ct.

## INVENTORS

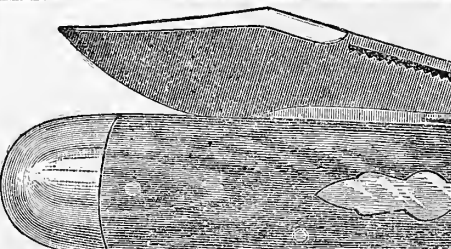

address SOULE & CO.,  
Washington, D. C., for FREE  
important information

## CURIOSITIES.

Small Box of Sea Shells  
sent to any address for  
10 cents. S. C. THOMPSON, Jr., South Haven, Ct.

## Asparagus--New Variety.

Smaller's Extra Early Defiance; 2 weeks earlier than Colossal, a larger, softer grass; far superior to all other varieties. One acre will produce more grass with the same treatment than 2 acres of Colossal. It is the best Asparagus grown, either for private use or for market. Two-year-old plants, \$5 per 100, \$30 per 1,000; seed, \$12 per lb. Address,  
**A. SMALLEY, Bound Brook, Box 93, N. J.**

by your patronage? Can send you good 1-blade, 25c; extra strong, 50c.; medium 2-blade, 50c.; extra strong 2-blade, made for hard service, (see cut in Oct. No.), 75c. Our Best 2-blade, oil temper, \$1. Ladies' 1-blade, 25c.; 2-blade, 50c. Pruners, oil temper, and every blade tested, \$1. Budders, 65c. Hunting Knife, \$1. Illustrated List free. Discount to dealers.  
Sample 6-inch, hand-forged Butcher Knife, post-paid, 50c.

The Oldest Bee Paper in America—Established in 1861.

## AMERICAN BEE JOURNAL,

Devoted to Scientific Bee-Culture, and the Production and Sale of Pure Honey. \$1.50 a year in advance.  
THOMAS G. NEWMAN,  
974 West Madison Street, Chicago, Ill.

## CHROMO

Cards.—5 gold chromo, 5 silver chromo, 5 floral chromo, 5 floral motto, with name, 10c; 6 packs, 50c. Royal Card Co., Northford, Conn.

## 1 DOZEN ELEGANT CHROMO BUSINESS CARDS,

artistic designs, assorted, for 5c. Sent post free on receipt of price in stamps. Address W. JENNINGS DEMOREST, or MME. DEMOREST, 17 East 14th St., N. Y.

## VIRGINIA FARMS!

All sizes and prices, for Sale. Write for Catalogue, free.  
**H. L. STAPLES & CO., Richmond, Va.**

## DO YOUR OWN PRINTING.

Presses and outfits from \$3 to \$500. Over 2,000 styles of type. Catalogue and reduced price list free.  
**H. HOOVER, PHILADELPHIA, PA.**

## Best Holiday Gift!

Friends! here's comfort. Wife says she must have a couple of Common-Sense Rockers. We all want this one. Special discount to clergymen. Send stamp for catalogue to

**F. A. SINCLAIR,**  
**Mottville, N. Y.**

## MARKS' PATENT FIRST PREMIUMS.

Artificial Limbs, with Rubber hands and feet. The most reliable, comfortable and useful. Illustrated pamphlet of 112 pages, containing valuable information sent free to those giving satisfactory description of their case. U. S. Gov't Manuf. Soldiers' attention especially invited. A. A. MARKS, 575 Broadway, New York City.

## PORTRAITS

Oldest and Largest Photo-Copying and Portrait House in America. Every Agent in this business should send for our New Price Lists. We have something new at very low prices. 10 first-class Artists wanted.  
**TEN EYCK & CO., Auburn, N. Y., or**  
**56 Washington St., Chicago, Ills.**

## SCROLL SAWYER.

This Three-Shelf Bracket Design, size 13x21, and over 300 miniature designs for Scroll Sawing, sent post-paid on receipt of 10 cts. and the names and addresses in full of two active scroll-sawyers. Price of pattern alone, 15 cts. Or send two stamps for illus. Catalogue of scroll saw goods. I offer inducements to purchasers made by no other house. Liberal discounts to the trade. State where you saw advertisement.  
**A. H. POMEROY,**  
**Hartford, Conn.**

## 20 CHROMO CARDS,

10 cts.; no two alike, with name, post-paid; stamps taken. Best ever sold, or money refunded. J. B. HUSTED, Nassau, N. Y.

## 50

All Gold, Silver, Shell, Motto, and Floral Chromo Cards in beautiful colors with name 10c. Agents Sample Book, 25c. Star Printing Co., Northford, Conn.

## 50

Gold Chromo, Motto, Horseshoe, Scrolls, etc., Cards, with name, in Case, 10c., or 25 Acquaintance Cards, 10c. E. H. PARDEE, Fairhaven, Conn.

## 30

Chromo, Gold-Border, Motto, etc. Cards with name and Morocco Case, 10c.  
**H. M. COOK, Meriden, Ct.**

## 50

Finest Chromo, Gilt and Colored, Scroll Cards ever sold, only 10c. Agents' Samples, 10c.  
**G. A. SPRING, Northford, Ct.**

## 20

GOLD AND SILVER CHROMO CARDS, with name, 10c., postpaid.  
**G. I. REED & CO., Nassau, N. Y.**

## Another New Knife.

MAHER & GROSCH, Cutlery, Toledo, Ohio, will send knife like cut, post-paid, for 75c.; Blades are made for keen, clean cutting; handle has no corners.—"Of the 24 knives received from you all have given satisfaction." D. F. Cully, Dalton, O.—"The knife I bought of you is the best I ever had." J. E. Lyman, Kellogg, Iowa.—"Your goods when used prove what you say about them." R. B. Rollin, Tawas City, Mich.—The above are samples of letters received by us every day. If our goods were not good, we would not be allowed to advertise them here. Will you not help us

## BUCHAN'S CARBOLIC Medicinal Soap.

The Healing, Purifying, and Disinfecting properties of Carbolic Acid are among the most wonderful facts disclosed by modern science. The best, safest, and most convenient method of using this wonderful Curative is in the form of Soaps.

This Soap is highly prized by physicians and nurses for the sick-room. It purifies and disinfects all unpleasant and dangerous odors, prevents the spread of contagion, and is invaluable in curing sores, eruptions, and all cutaneous diseases.

Buchan's Carbolic Medicinal Soap is for sale at all Druggists.

WHOLESALE DEPOT.  
KIDDER & LAIRD, 83 John St., New York.

**FOR THE SHEEP FARMER'S SCOURGE.**  
Worms in the throat, and internal Parasites in Sheep and Lambs, **THE NEW SHEEP DIP, LITTLE'S CHEMICAL FLUID**, is a cure. Send 3-cent stamp for testimonials, price, etc., to T. W. LAW FORD, Gen'l and Wholesale Ag't., No. 296 E. Chase St., Baltimore, Md.

University of the State of New York.

## American Veterinary College.

141 West 54th St. NEW YORK CITY.

The regular course of lectures commences in October, each year. Circular and information can be had on application to

A. LAUTARD, M.D.V.S.,  
Dean of the Faculty.

## POULTRY WORLD.

A monthly magazine, the oldest, largest, and best periodical devoted entirely to poultry ever published. Splendidly illustrated. \$1.25 per year. Also the *American Poultry Yard*, the only weekly paper devoted entirely to poultry in existence. \$1.50 per year. Both papers for \$2.00. A sample copy of both mailed on receipt of nine cents in postage stamps.

Address H. H. STODDARD, HARTFORD, CT.

**GAME FOWL BRED & SHIPPED.**  
Also Sporting Dogs and Cattle, by J. C. COOPER, Cooper Hill, Limerick, Ireland.

**\$10.00 BRONZE and NARRAGANSETT TURKEYS.** Bred ten years for size and plumage. \$10.00 a pair. 20 per cent off until Dec. 1st. For pick of flock order now. W. CLIFT, Mystic Bridge, Ct.

## WM. CROZIER,

BEACON HILL, Northport, Long Island, N. Y.  
Importer and Breeder of Ayrshire, Guernsey, and Jersey Cattle, which always take the Highest Awards at County, State, National, and International Shows. South-down Sheep direct from Lord Walsingham's flock in England. Berkshires of the highest type. Collie Dogs of my own selection on the Highlands of Scotland. An inspection of the stock invited. Only 2 hours from N. Y. City.

## NOVELTY INCUBATOR.

I offer this as the simplest, cheapest, and best Incubator in the market. Costing less than 3 cts. per day for oil. Hatches 80 to 90 per cent almost surely. Holds 100 Eggs. Price, \$30.00, ready for shipment.

Also **NOVELTY HYDRO-MOTHER.** Price, \$8.50, ready for shipment. Circulars giving full particulars on application.

A. G. ATKINS, Orange, N. J.

A book devoted entirely to PLYMOUTH ROCK fowls, also a separate book on WHITE LEGHORNS, another on BROWN LEGHORNS, a book on curing POULTRY DISEASES, and another entitled *How to Feed FOWLS*. Either of the above mailed for 25 cts., or all five for \$1.00. Address the author

H. H. STODDARD, Hartford, Ct.

## THOROUGHbred & CROSS-BRED JERSEY STOCK.

10 Thoroughbred Heifers and Cows, 3 to 8 years old.  
5 " Bulls, 8 months to 3 years old.  
10 " Heifers, 6 to 8 months old.  
5 " Yearlings past, in calf.

All the above are registered or entitled to registry in the A. J. C. Club Register.

25 Cross-bred Heifers and Cows 2 to 7 years old. These are a mixture of the two breeds, Jerseys and Ayrshires, the best Family or Butter Cows I have ever bred. All are rich milkers and butter-makers. Some of them 2-lb. Cows. No printed circulars issued. My prices range from \$45 for a high grade Heifer calf, to \$500 for the best thoroughbred Cow. Purchasers are invited to examine the Stock in person, in preference to my own selection.

THOMAS FITCH, New London, Conn.

85,000,000 RINGS SOLD.

Man of U. S. Showing No. and price of Live Stock mailed free; also Catalogue of Ringers, Rings, Stock Markers, Barbs for Board, Fences, Hooks, Ladies, Ditch Cleaners.

- (1) Diapason.
- (2) Dulcet.
- (3) Dulciana.
- (4) Echo.
- (5) Celeste.
- (6) Clarinet.
- (7) Sub-Bass.
- (8) Coupler.
- (9) Vox Humana.
- (10) Diapason Forte.
- (11) Aeoline.
- (12) Celestina.
- (13) Flute.
- (14) Flute Forte.
- (15) Grand Organ Knee Stop.

No. 875, 70 Inches high, 48 Inches long

### 4 Sets of Reeds.

as follows:  
One set of powerful Sub-Bass  
One set, 3 octaves, Vox Celeste, & 2½ octaves each of regular Diapason Reeds, with Coupler, which doubles the power.

We are determined that every one shall have an opportunity to test this magnificent Organ. We therefore put the price at \$60, and send on Fifteen Days Trial. We send with every Organ a STUOL, MUSIC and INSTRUCTION BOOKS.

**Making a Complete Musical Outfit for \$60.**

**PLEASE SEND IN YOUR ORDER AT ONCE.** Remit by Post Office Money Orders, Express Prepaid, or by Draft on New York. Money refunded and freight charges paid both ways if any way unsatisfactory, or you may pay only after you have fully tested it at your own home for fifteen days. Send reference or evidence of your responsibility if you do not send cash with order. The reason we offer this Organ so low is to have it introduced everywhere. Hence this unparalleled offer. Order at Once. Every Organ we manufacture, when introduced in a new locality, sells many more.

### THE ONLY HOUSE IN AMERICA

That offers a Five Octave Organ, Four Sets of Reeds, having

## SUB-BASS, COUPLER, CELESTE & GRAND ORGAN FOR \$60

With Stool, Music and Instruction Book complete. Sent for trial and examination. Guaranteed Six Years. You take no responsibility till you receive and approve the Organ.

**TWENTY YEARS WITHOUT ONE DISSATISFIED PURCHASER.**

A MOMENT'S CONSIDERATION will show the certainty of securing a superior instrument from us. Dealers can trust to their own shrewdness and the ignorance of purchasers to conceal defects in the instruments they sell. We can not know who will test ours, and must send instruments of a quality so superior that their merits can not be hidden. Order direct from this advertisement. You take no responsibility. Nothing gained by correspondence.

The Deaf should send for FREE Illustrated descriptive Pamphlet to **American Dentaphone Co., 163 W. 4th St., Cincinnati, O.**

**L. E. RANSOM, 34 MAIDEN LANE, N. Y. CITY.** Perfect Butter Color at lowest prices.

## New Folding Fret Saw.

Every home, however humble or magnificent, is more beautiful if adorned with brackets and other work produced by home hands. Hundreds of thousands of such homes now exist, where only the slow and tedious hand frame fret saws have been available. More recently the foot-pedal and multiplying wheels have come into use, and the increasing demand has tended to cheapness and improvement. We are now happy to announce another large advance in Perfection, Cheapness, and Portability, by which are secured stronger, better working machines; a material reduction in price, and a great saving in cost of carriage or delivery, as well as in storage room when not in use, with sundry other improvements and advantages.—All the above are secured in this new saw. By a simple arrangement the table is lowered to a convenient working height for a boy of 5 or 6, or raised high enough for the tallest man, and at every height it stands firmly, and when not in use, it can be folded up and put away. It has a tilting table, and will execute fine scroll-work or inlaid work. Though as strong and durable as any one could desire, the weight is ONLY 15 LBS. The Editors and Publishers of the *American Agriculturist* were so pleased with this new machine that they at once secured the control of it for the benefit of their readers. Price, \$2.25. Receiver to pay expressage.

## Combination Fret Saw, Lathe, Etc.

**Beach's New Improved American Combination Fret Saw**, Handsome in Design, and claimed to be the Lightest Running and Best Made Tool in the World for the Price; and unequaled for Cheapness, Simplicity, Speed, and Efficiency. Several engravings and much space would be required to explain all its parts, and its working, ingenious improvements, etc. Full descriptive circulars sent when desired. Is built almost wholly of iron and steel; stands firmly without fastening down. Will cut Horn, Ivory, Pearl, Shell, Brass, and all kinds of Wood up to 1½ inch thick. Saw runs straight up and down. Has a tilting table to cut at

angles. Has Air-pump which drives all sawdust from the work. Has 20 inches swing, for largest Brackets. Has **Drill Attachment** always ready for use. Also **Turning Lathe** for work 12 inches long, and 4 inches diameter, with speed of 1,500 revolutions per minute. Also set of **Steel Turning Chisels**, made from *Jessup's Best Improved English Steel*. Price complete, including Lathe and **Drilling Attachment**, one Morse

Flint Drill, Wrench, Oil Can, Screw-driver, six Improved Fret Saws, and one large Saw 8½-inch wide for cutting up timber. Also one set of Turning Chisels, boxed tight, and delivered on car at Factory all for \$8—a reduction of \$3 from last year's price. Receiver to pay expressage.

## WHISTLING LOCOMOTIVE.

This new Toy is a marvel as to its simplicity. At every revolution of the "driving wheels" there is produced a good, strong whistle, which adds greatly to the liveliness and interest of the Toy, and gives much pleasure to the boy or girl—the young engineer who runs it. It is finely painted, and it can be easily seen, from the dimensions as given, that there is a great deal in it for a \$1.00 Mechanical Toy.

Price, \$1.00. Expressage to be paid by the recipient.

Length, 37 inches—Height, 10½ inches.

## CRANDALL'S DISTRICT SCHOOL.

Every child, and man and woman too, will laugh over this group of teacher and scholars in the "district school," and thousands of parents will recall with great delight their own experiences in childhood. The grave "master," seated by the desk, with his "whisking stick"; the boys and girls with their books; the "little lamb" that has followed his young owner into the school; the "dunce" and his cap, and the altogether comical appearance of the whole company, make this one of the most attractive toys of Crandall's invention.

Price \$1.00; by mail, prepaid, \$1.20.

Send for a Price List of all our Toys and Games, Scroll Saws, etc.

**ORANGE JUDD COMPANY,**  
245 BROADWAY, NEW YORK.

## Special Proposition!
